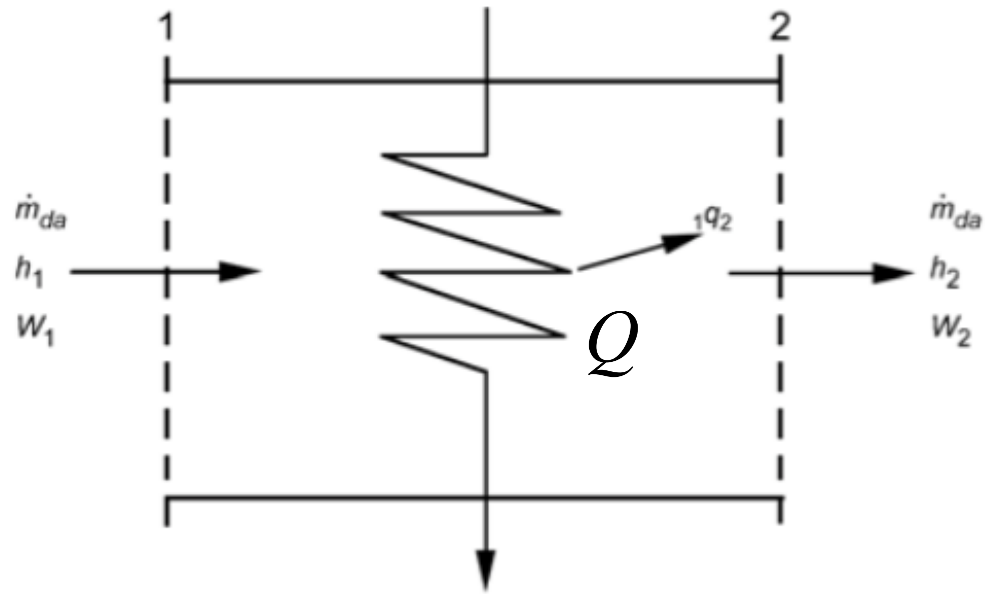
PSYCHROMETRIC PROCESSES

Using energy and mass balance equations

Energy/mass balances for psychrometric processes

Heating air



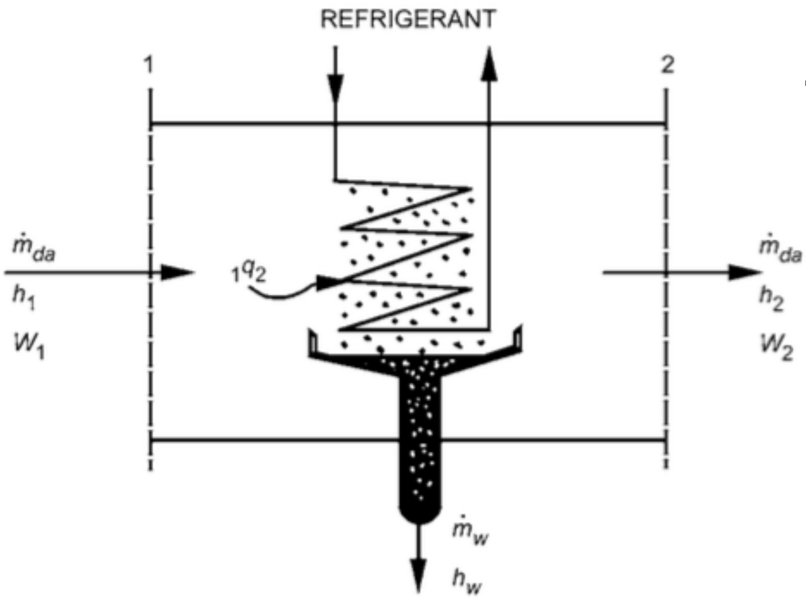
Energy balance: $\dot{m}_{da,1}h_1 + Q_{1\to 2} = \dot{m}_{da,2}h_2$

Mass balance on air: $\dot{m}_{da,1} = \dot{m}_{da,2} = \dot{m}_{da}$

Mass balance on water vapor: $\dot{m}_{da,1}W_1 = \dot{m}_{da,2}W_2$

Therefore: $Q_{1\to 2} = \dot{m}_{da}(h_2 - h_1)$

Energy/mass balances for psychrometric processes



Cooling and dehumidifying

*Note that $h_w = h_g$ for steam/vapor and $h_w = h_f$ for water

Energy balance: $\dot{m}_{da,1}h_1 + Q_{1\to2} = \dot{m}_{da,2}h_2 + \dot{m}_w h_{w,2}$

Mass balance on air: $\dot{m}_{da,1} = \dot{m}_{da,2} = \dot{m}_{da}$

Mass balance on water vapor: $\dot{m}_{da,1}W_1 = \dot{m}_{da,2}W_2 + \dot{m}_w$

Note: error in sign last lecture PPT

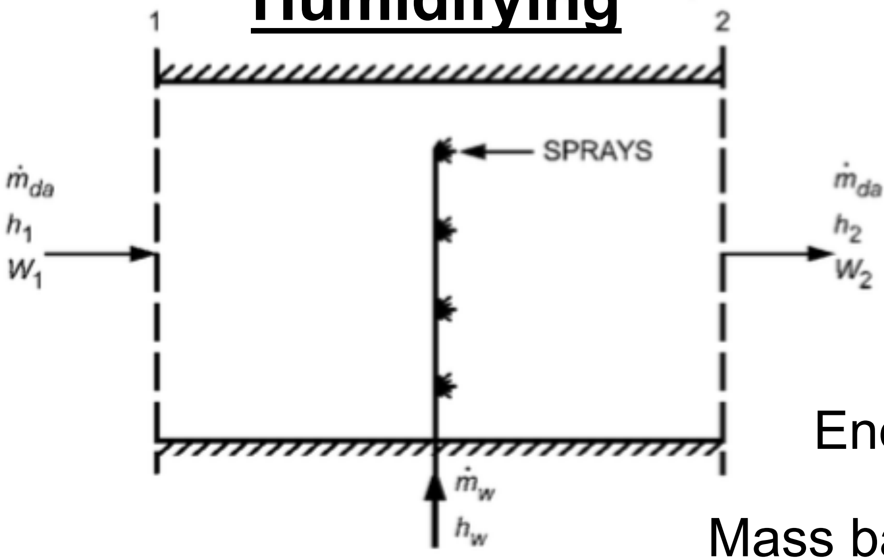
Therefore: $\dot{m}_w = \dot{m}_{da}(W_1 - W_2)$

And: $Q_{1\to2} = \dot{m}_{da}[(h_2 - h_1) - (W_2 - W_1)h_{w,2}]$

(Q is negative for cooling)

Energy/mass balances for psychrometric processes

Humidifying



Energy balance: $\dot{m}_{da,1} h_1 + \dot{m}_w h_w = \dot{m}_{da,2} h_2$

Mass balance on air: $\dot{m}_{da,1} = \dot{m}_{da,2} = \dot{m}_{da}$

Mass balance on water vapor: $\dot{m}_{da,1} W_1 + \dot{m}_w = \dot{m}_{da,2} W_2$

Therefore: $\dot{m}_w = \dot{m}_{da}(W_2 - W_1)$

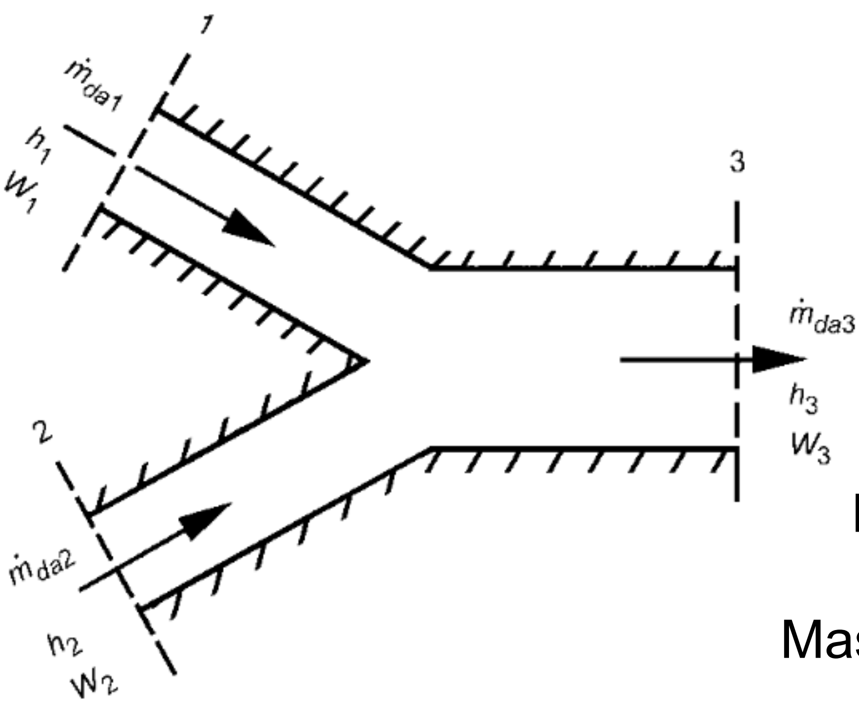
And: $\dot{m}_w h_w = \dot{m}_{da}(h_2 - h_1)$

And: $\dfrac{h_2 - h_1}{W_2 - W_1} = \dfrac{\Delta h}{\Delta W} = h_w$

*Note that h_w = h_g for steam/vapor and h_w = h_f for water

Energy/mass balances for psychrometric processes

- **<u>Mixing</u>:** Often in HVAC systems we mix airstreams adiabatically
  - **Adiabatically** = Without the addition or extraction of heat
  - e.g. outdoor air mixed with a portion of return/recirculated air



Energy: $\dot{m}_{da,1}h_1 + \dot{m}_{da,2}h_2 = \dot{m}_{da,3}h_3$

Mass (air): $\dot{m}_{da,1} + \dot{m}_{da,2} = \dot{m}_{da,3}$

Mass (water): $\dot{m}_{da,1}W_1 + \dot{m}_{da,2}W_2 = \dot{m}_{da,3}W_3$

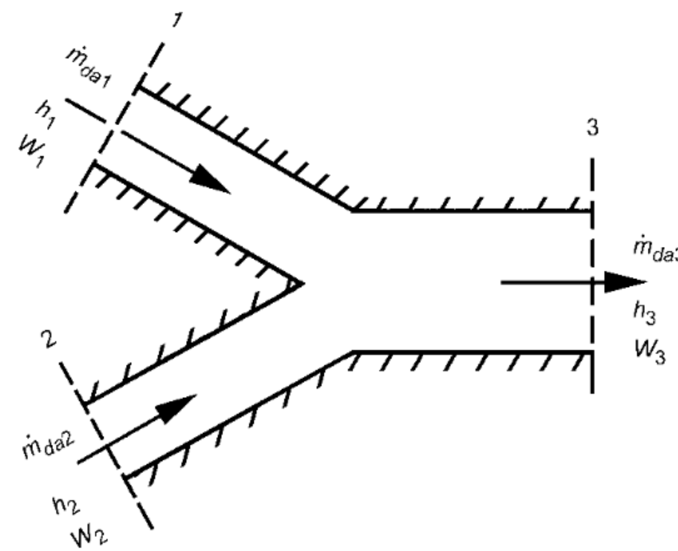
Energy/mass balances for psychrometric processes

- **<u>Mixing</u>:** For most parameters, the outlet conditions end up being the weighted averages of the input conditions based on their mass flow rates
  - Dry bulb temperature
  - Humidity ratio
  - Enthalpy
  - (not RH!)

$$T_3 = \frac{\dot{m}_{da1} T_1 + \dot{m}_{da2} T_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

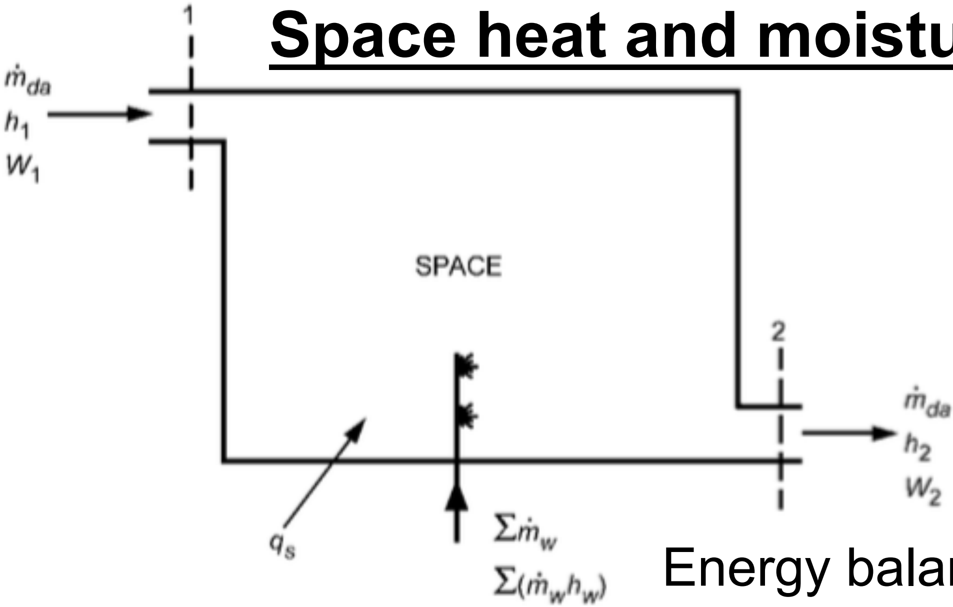
$$W_3 = \frac{\dot{m}_{da1} W_1 + \dot{m}_{da2} W_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

$$h_3 = \frac{\dot{m}_{da1} h_1 + \dot{m}_{da2} h_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$



Energy/mass balances for psychrometric processes

Space heat and moisture gains



Energy balance: $\dot{m}_{da} h_1 + Q_{gains} + \sum \dot{m}_w h_w = \dot{m}_{da} h_2$

Mass balance on water vapor: $\dot{m}_{da} W_1 + \sum \dot{m}_w = \dot{m}_{da} W_2$

Therefore: $\sum \dot{m}_w = \dot{m}_{da}(W_2 - W_1)$

Therefore: $\sum \dot{m}_w h_w + Q_{gains} = \dot{m}_{da}(h_2 - h_1)$

And: $$\frac{\Delta h}{\Delta W} = \frac{\sum \dot{m}_w h_w + Q_{gains}}{\sum \dot{m}_w}$$

*Note that $h_w = h_g$ for steam/vapor and $h_w = h_f$ for water

PSYCHROMETRIC PROCESSES

Example problems

Example 1: Heating (IP)

- Moist air, saturated at 35°F, enters a heating coil at a rate of 20,000 CFM and air leaves the coil at 100°F
  - Find the required rate of heat addition

Example 2: Cooling and dehumidification (IP)

- Moist air at 85°F dry-bulb temperature and 50% RH enters a cooling coil at 10,000 CFM and is processed to final saturation conditions at 50°F
  - Find the tons of refrigeration required

W2 = 0.0077 lbw/lbda

Example 3: Mixing (IP)

- A stream of 5,000 CFM of outdoor air at 40°F dry bulb temperature and 35°F thermodynamic wet bulb temperature is adiabatically mixed with 15,000 CFM of recirculated air at 75°F dry bulb temperature and 50% RH
  - Find the dry bulb temperature, humidity ratio, and enthalpy of the resulting mixture

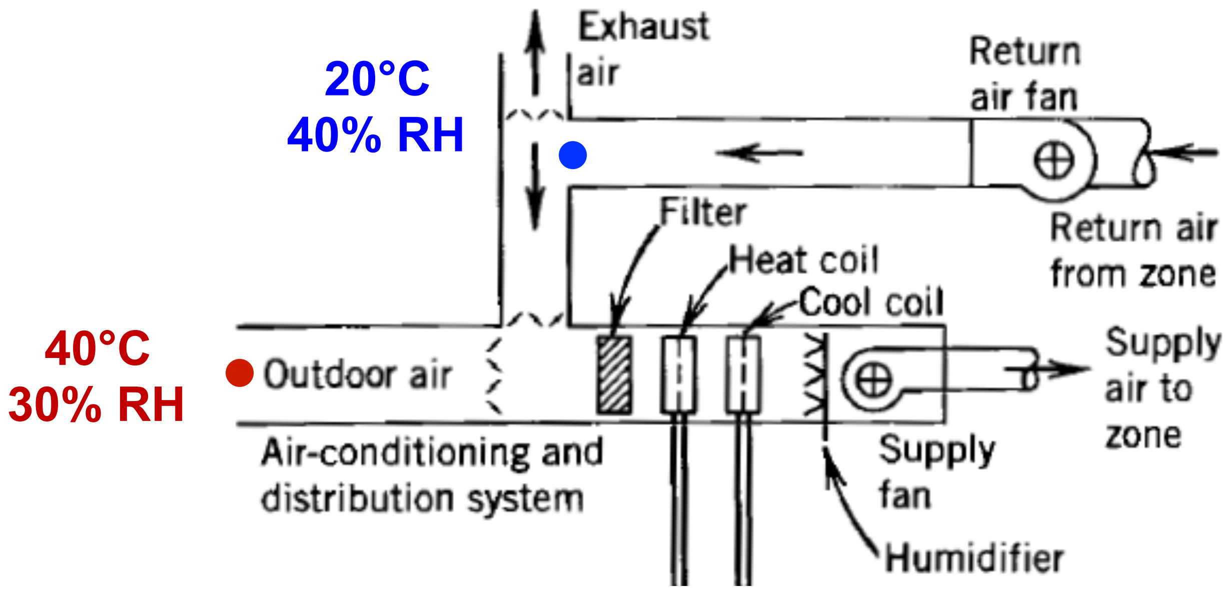
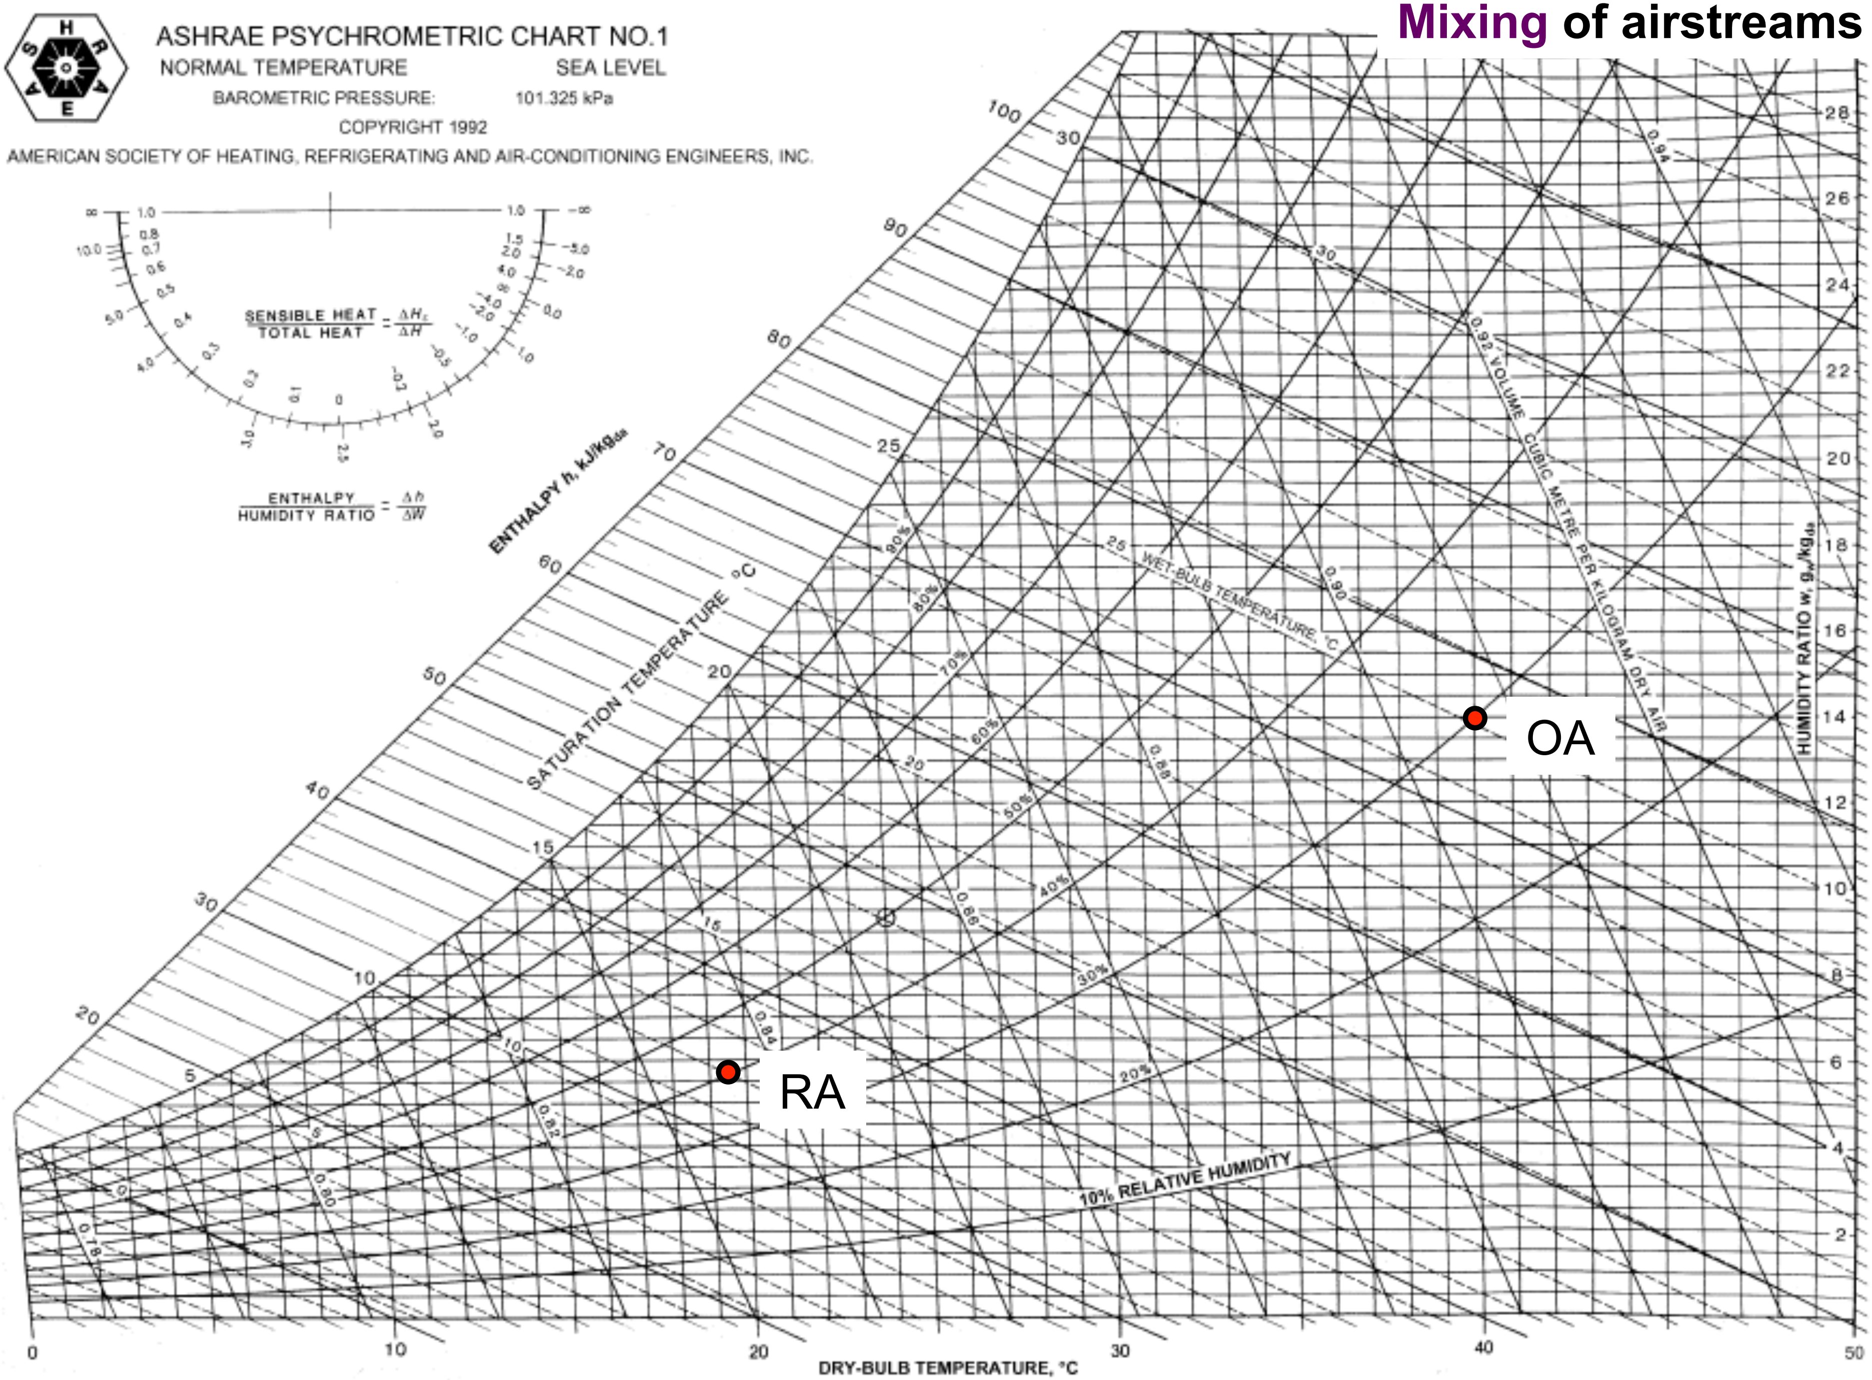
$W_{OA} = 0.0032$ lb_w/lb_{da}

Example 4: Mixing (SI)

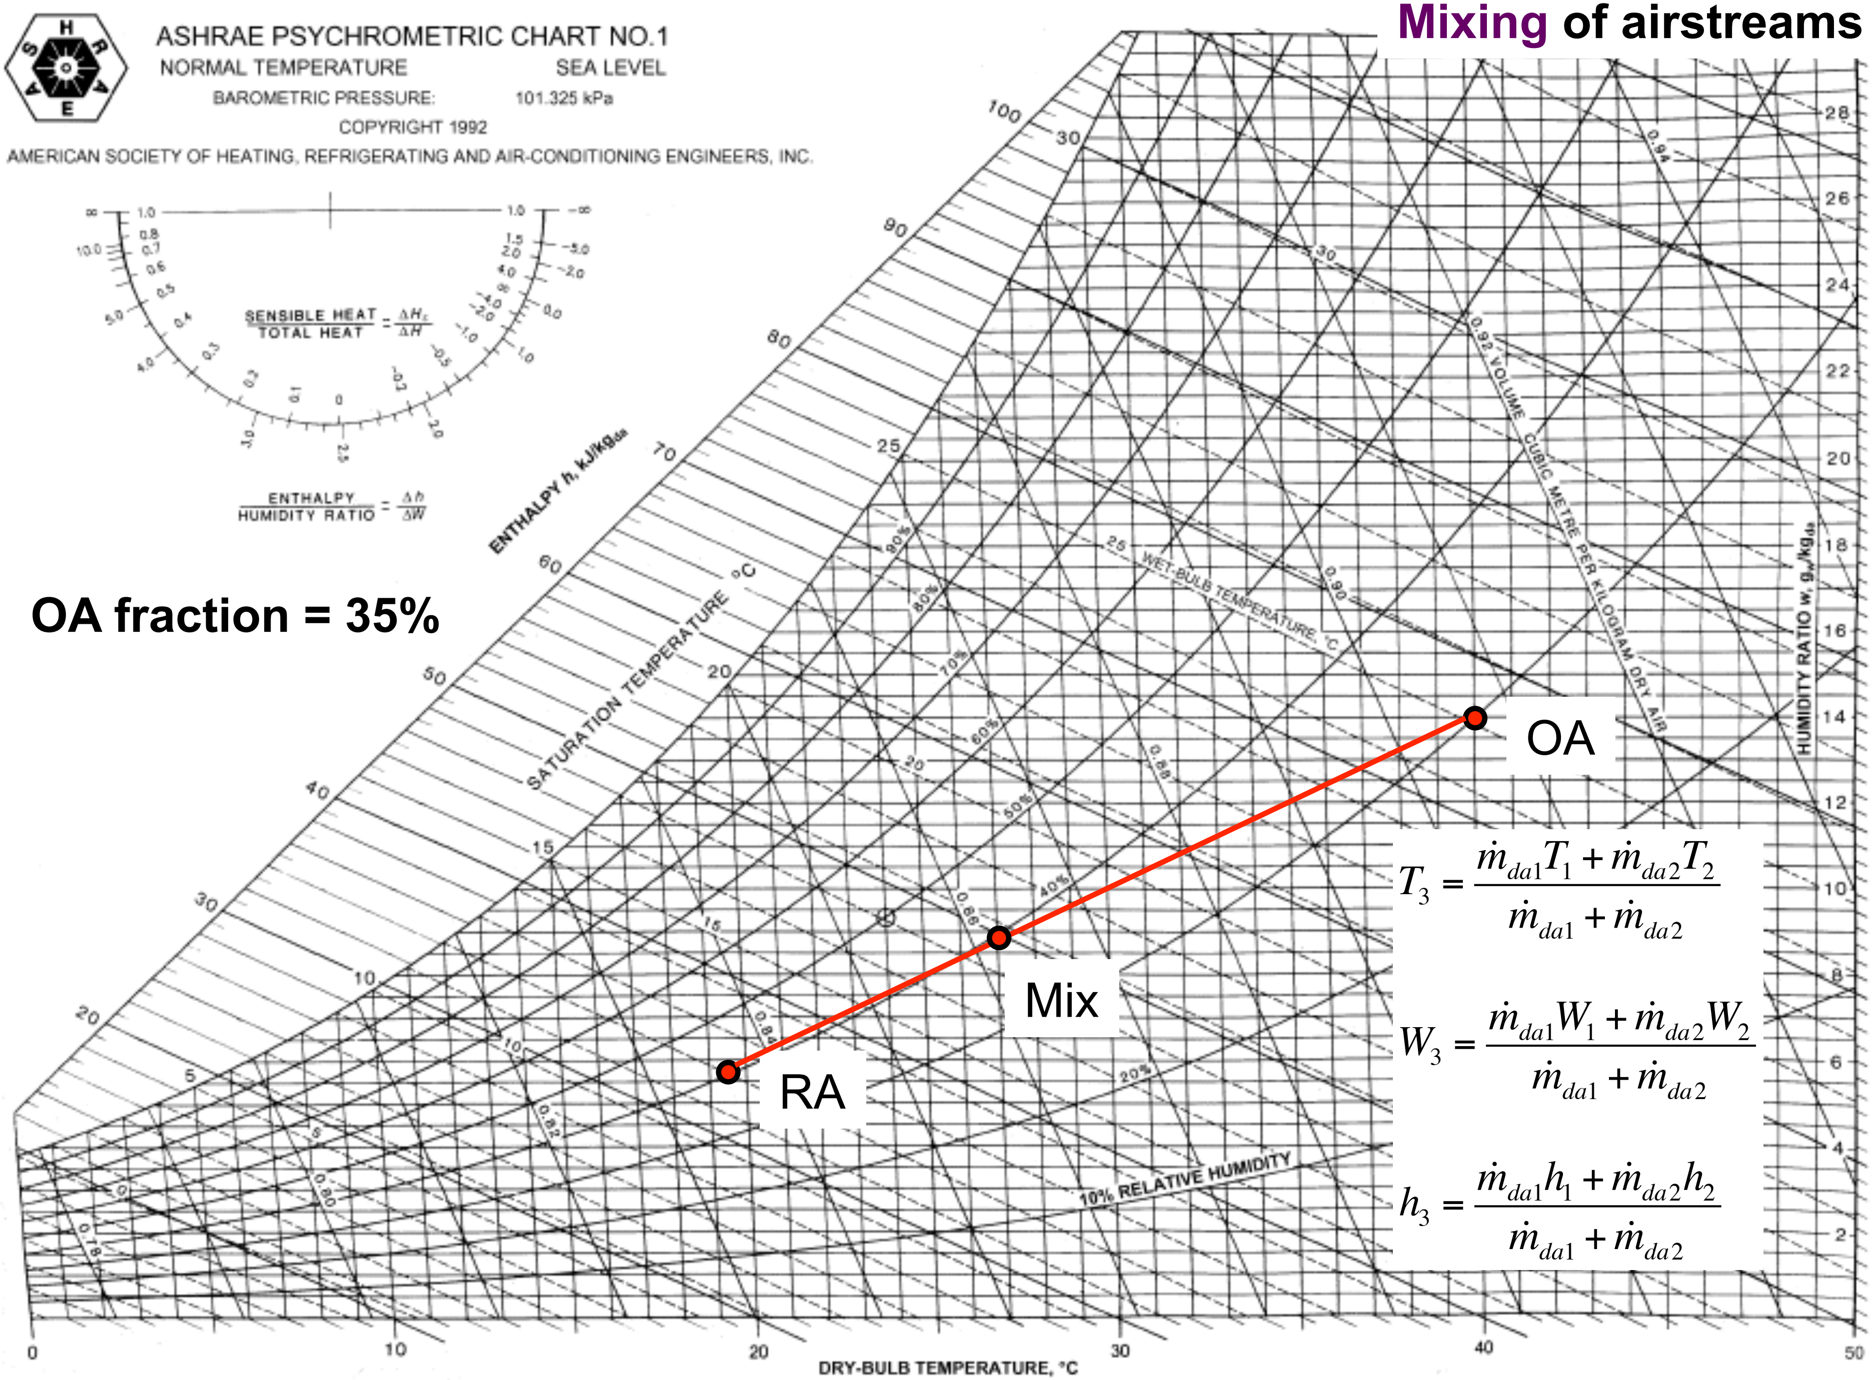
- Hot, humid outdoor air is mixed with recirculated indoor air at an outdoor air mass flow fraction of 35%
  - Q1: What is T, W, RH, and h at the mixed condition?



Mixing of airstreams



Mixing of airstreams



OA fraction = 35%

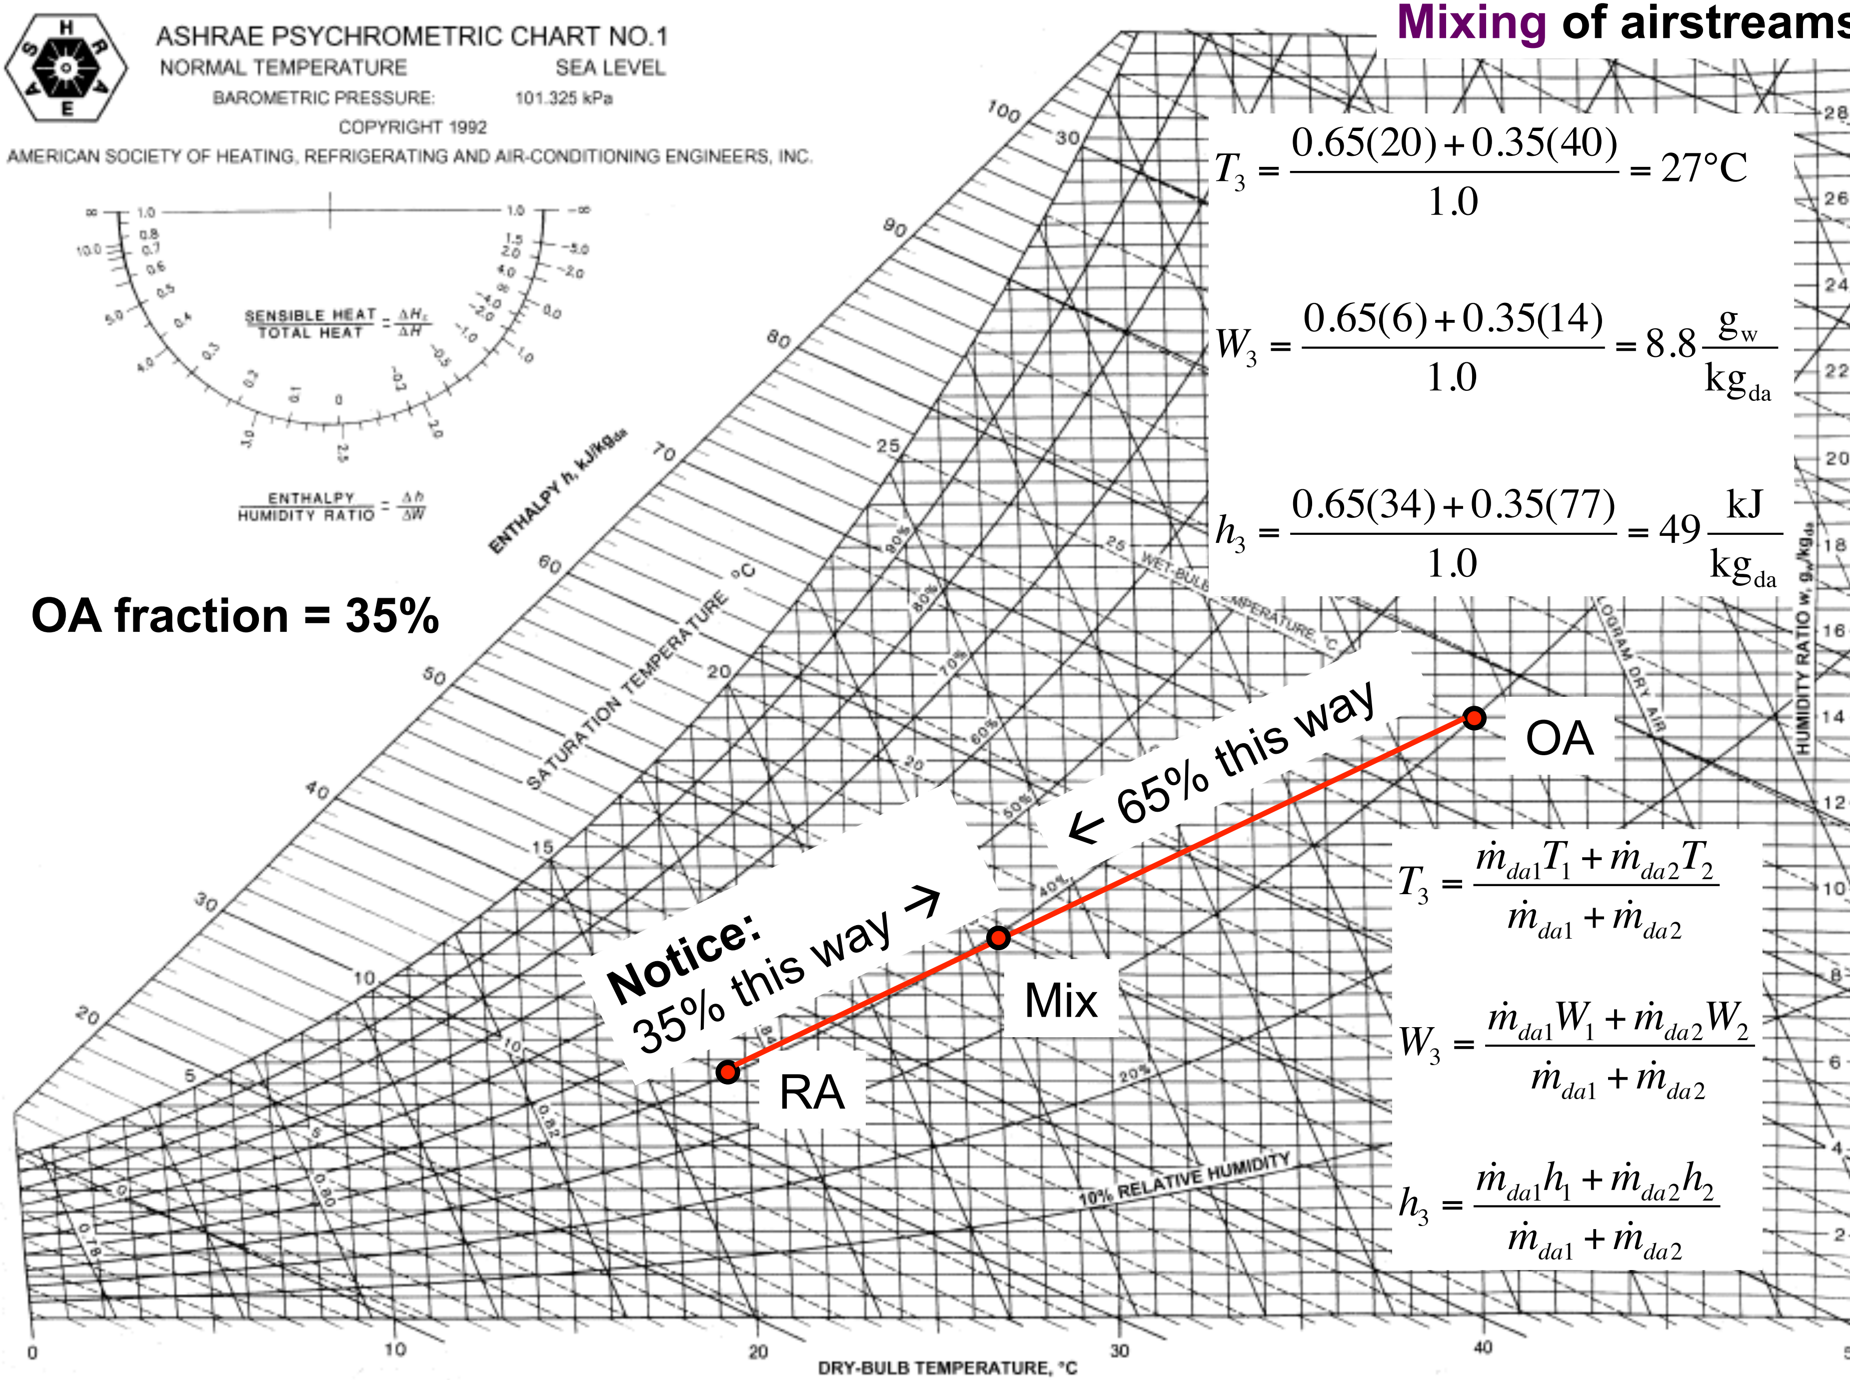
$$T_3 = \frac{\dot{m}_{da1}T_1 + \dot{m}_{da2}T_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

$$W_3 = \frac{\dot{m}_{da1}W_1 + \dot{m}_{da2}W_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

$$h_3 = \frac{\dot{m}_{da1}h_1 + \dot{m}_{da2}h_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

Mixing of airstreams

OA fraction = 35%



$$T_3 = \frac{0.65(20) + 0.35(40)}{1.0} = 27°\text{C}$$

$$W_3 = \frac{0.65(6) + 0.35(14)}{1.0} = 8.8\,\frac{\text{g}_\text{w}}{\text{kg}_\text{da}}$$

$$h_3 = \frac{0.65(34) + 0.35(77)}{1.0} = 49\,\frac{\text{kJ}}{\text{kg}_\text{da}}$$

$$T_3 = \frac{\dot{m}_{da1}T_1 + \dot{m}_{da2}T_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

$$W_3 = \frac{\dot{m}_{da1}W_1 + \dot{m}_{da2}W_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

$$h_3 = \frac{\dot{m}_{da1}h_1 + \dot{m}_{da2}h_2}{\dot{m}_{da1} + \dot{m}_{da2}}$$

Example 5: Humidification (IP)

- Moist air at 70°F dry bulb temperature and 45°F wet bulb temperature is to be processed to a final dew point of 55°F by adiabatic injection of saturated steam at 230°F
- The air flow rate is 10,000 CFM
  - Find the rate of steam flow required

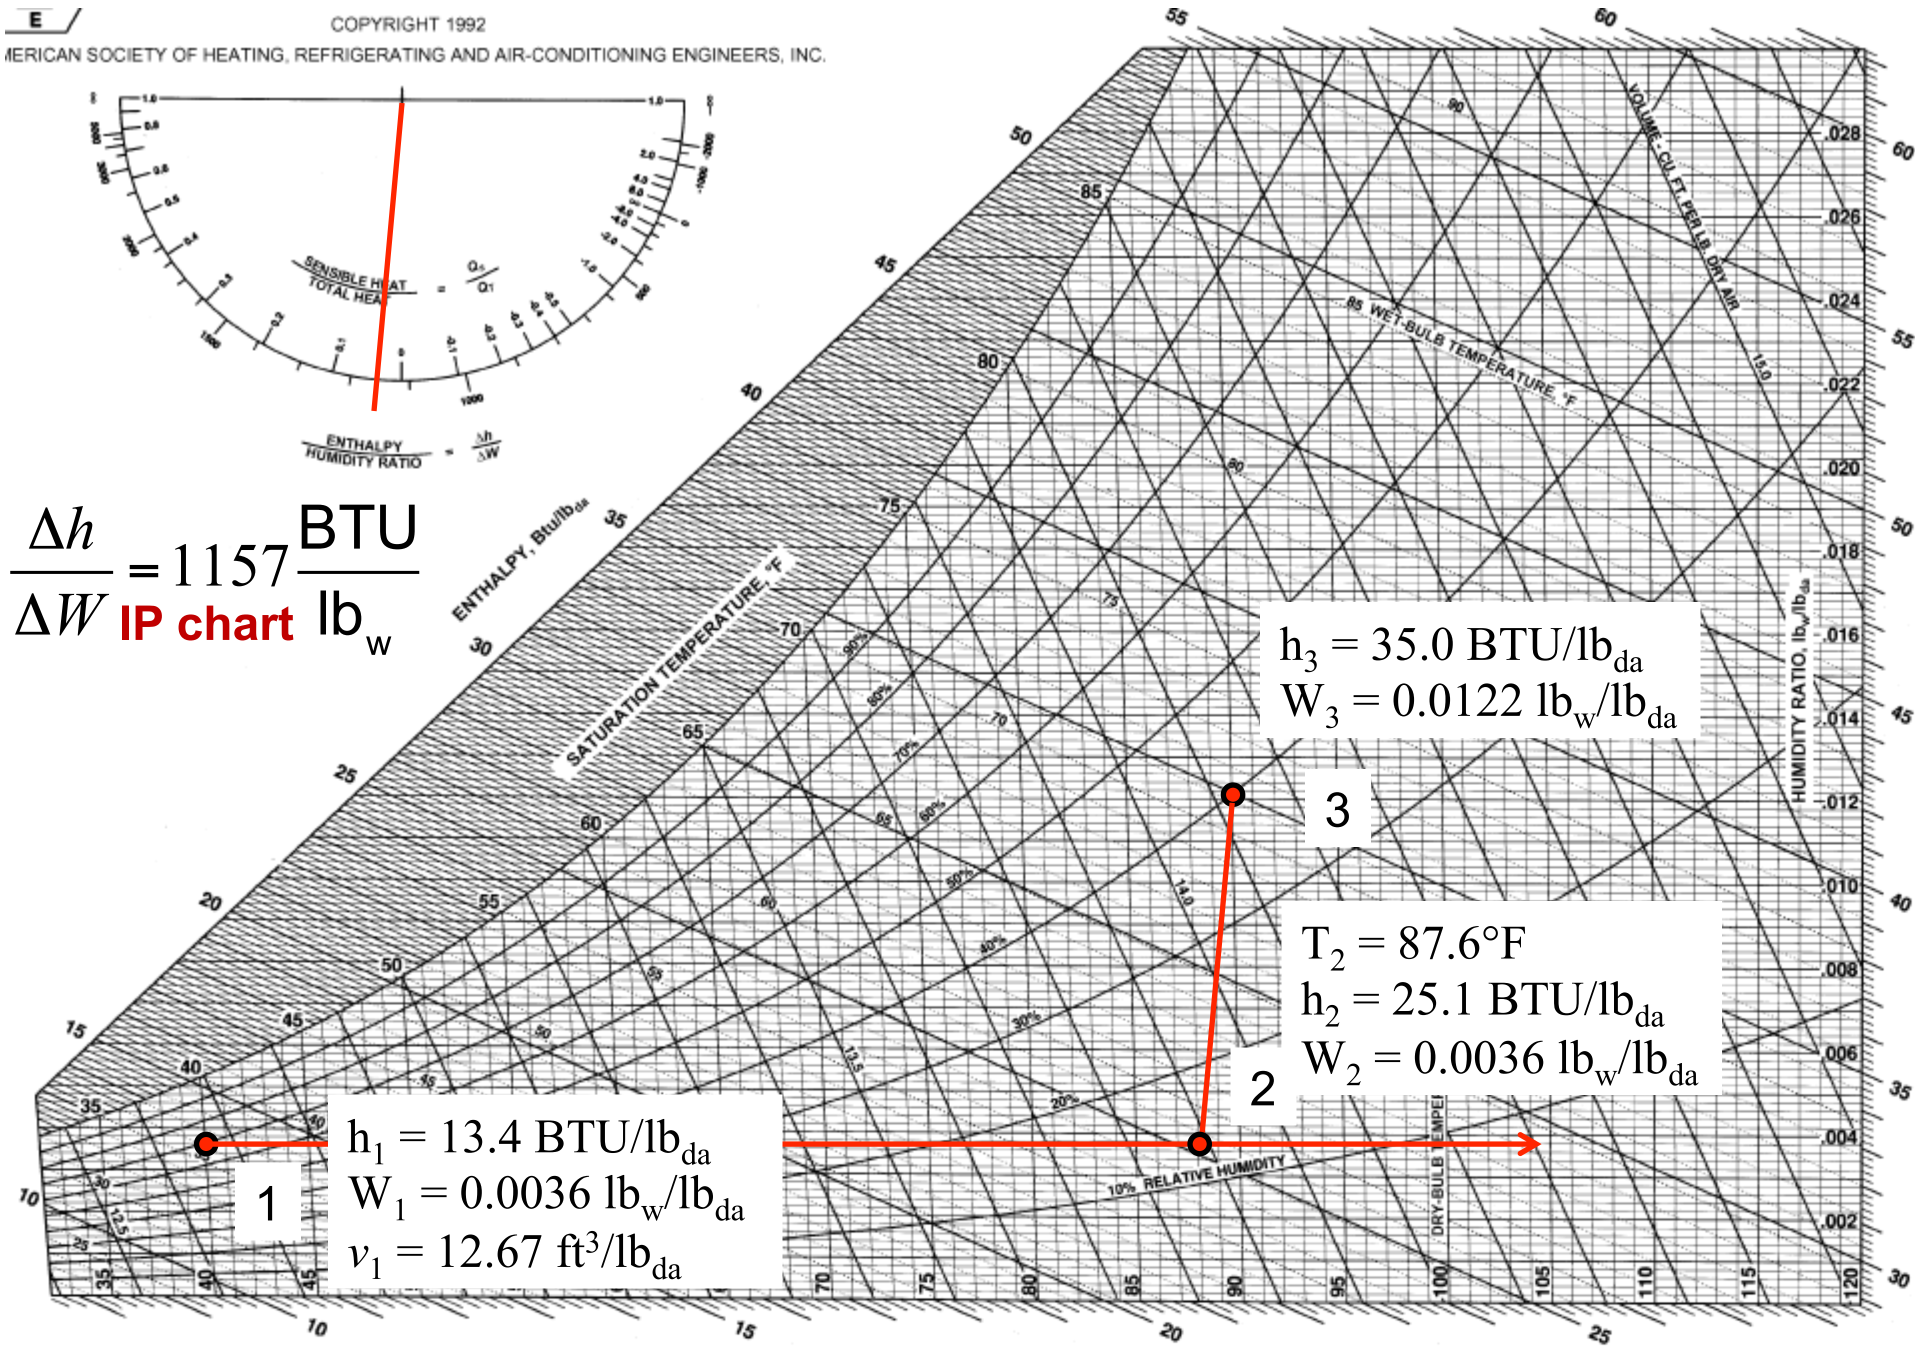
$$\frac{\Delta h}{\Delta W} = 1157 \frac{\text{BTU}}{\text{lb}_w}$$

Example 6: Heating and humidification (IP)

- Moist air is heated and humidified by passing it first over a heating coil and then adding moisture. The moist air enters the system at 40°F dry bulb temperature and 36°F wet bulb temperature at a mass flow rate of 235 lb_{da}/min. The humidifier injects saturated steam at 230°F. The moist air exists the system at 90°F dry bulb temperature and 40% RH.

- Locate state 2 on a psychrometric chart and determine the rate of heat addition by the heating coil and the rate of mass addition by the humidifier.

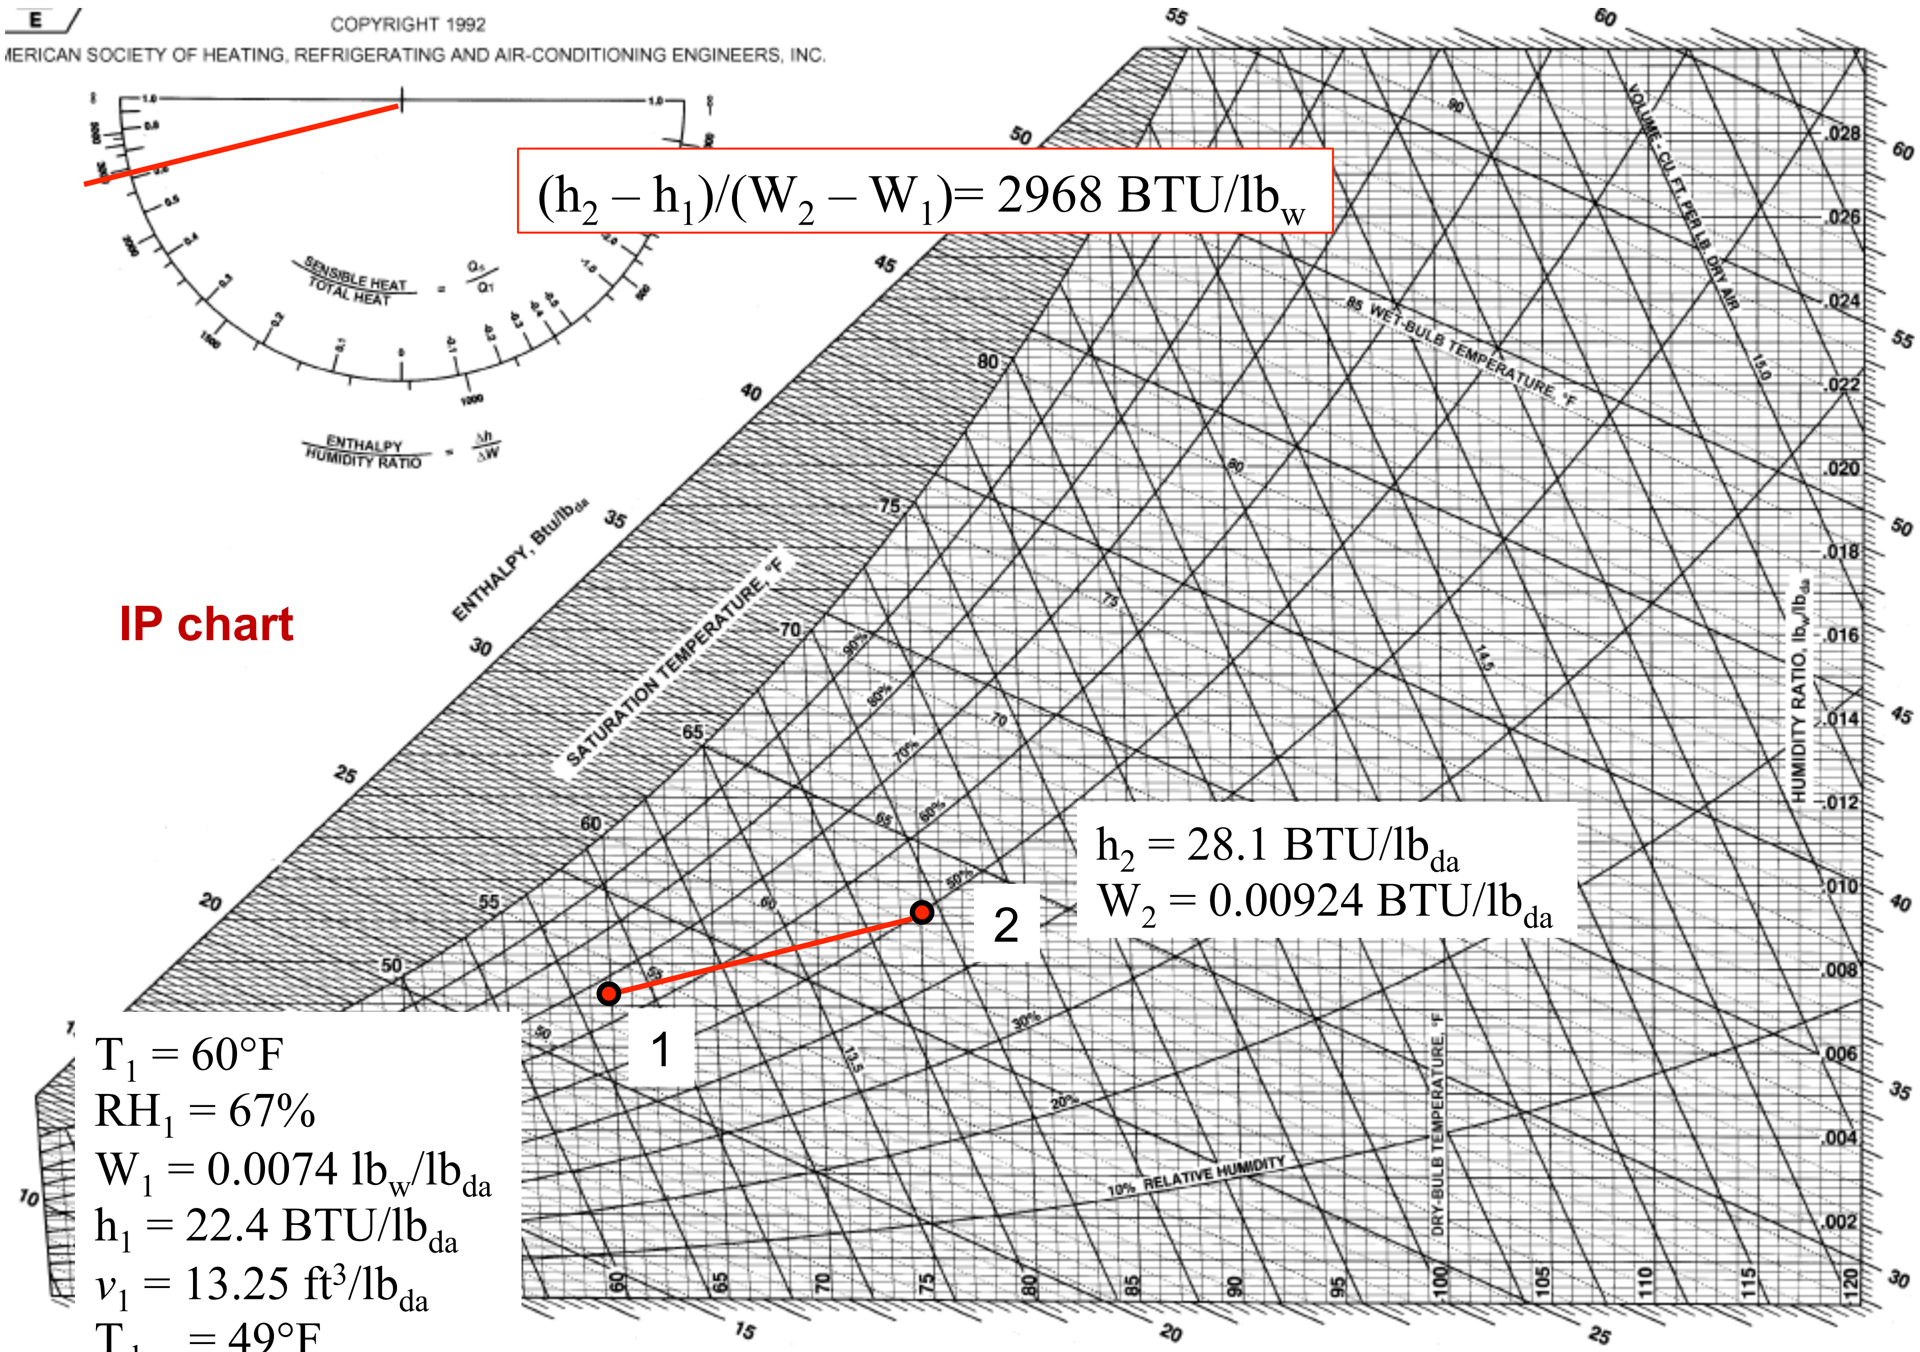
$$\frac{\Delta h}{\Delta W} = 1157 \frac{\text{BTU}}{\text{lb}_w} \quad \textbf{IP chart}$$



Example 7: Space conditioning – cooling (IP)

- The air in a restaurant is to be maintained at 75°F dry-bulb temperature and 50% RH. The load calculations for the restaurant estimate the rate of sensible heat gain to be 178,000 BTU/h. The rate of moisture gain is estimated to be 95 lb_w/h with an average enthalpy of moisture (h_w) of 1095 BTU/lb_w. The supply air temperature is to be 60°F. Assume standard atmospheric pressure.

- Determine the following:
  a) The required dew-point temperature of the supply air
  b) The required volumetric flow rate of supply air (in CFM)



IP chart

$(h_2 - h_1)/(W_2 - W_1) = 2968\ \mathrm{BTU/lb_w}$

$h_2 = 28.1\ \mathrm{BTU/lb_{da}}$

$W_2 = 0.00924\ \mathrm{BTU/lb_{da}}$

$T_1 = 60°\mathrm{F}$

$RH_1 = 67\%$

$W_1 = 0.0074\ \mathrm{lb_w/lb_{da}}$

$h_1 = 22.4\ \mathrm{BTU/lb_{da}}$

$v_1 = 13.25\ \mathrm{ft^3/lb_{da}}$

$T_{dew} = 49°\mathrm{F}$

Example 8: Single-zone space conditioning (IP)

- Assume the restaurant from the previous example is to be served by an air handling unit that mixes outdoor air with recirculated air, then passes the air over a cooling coil to the space. Outside air conditions are 92°F dry bulb and 77°F wet bulb temperatures. The rate of exhaust from the restaurant is 4500 CFM.

- Determine the following:
  a) The mass flow rate of recirculated air
  b) The thermodynamic state of the moist air entering the cooling coil
  c) The refrigeration capacity required
