Mechanical Engineering Tips in Commercial Buildings

SPEAKER

Mechanical Engineer

Danielle Passaglia

WHEN

February 23rd, 2023
12:40 pm – 1:40 pm

WHERE

John T. Rettaliata Engineering Center, RE 242

TALK ABOUT

- ✓ Work Experiences
- ✓ Careers in Mechanical Engineering
- ✓ Skill in Engineering Simulation Tools

For more information, feel free to contact ASHRAE official email
ashrae_iit@iit.edu

Interested in Joining

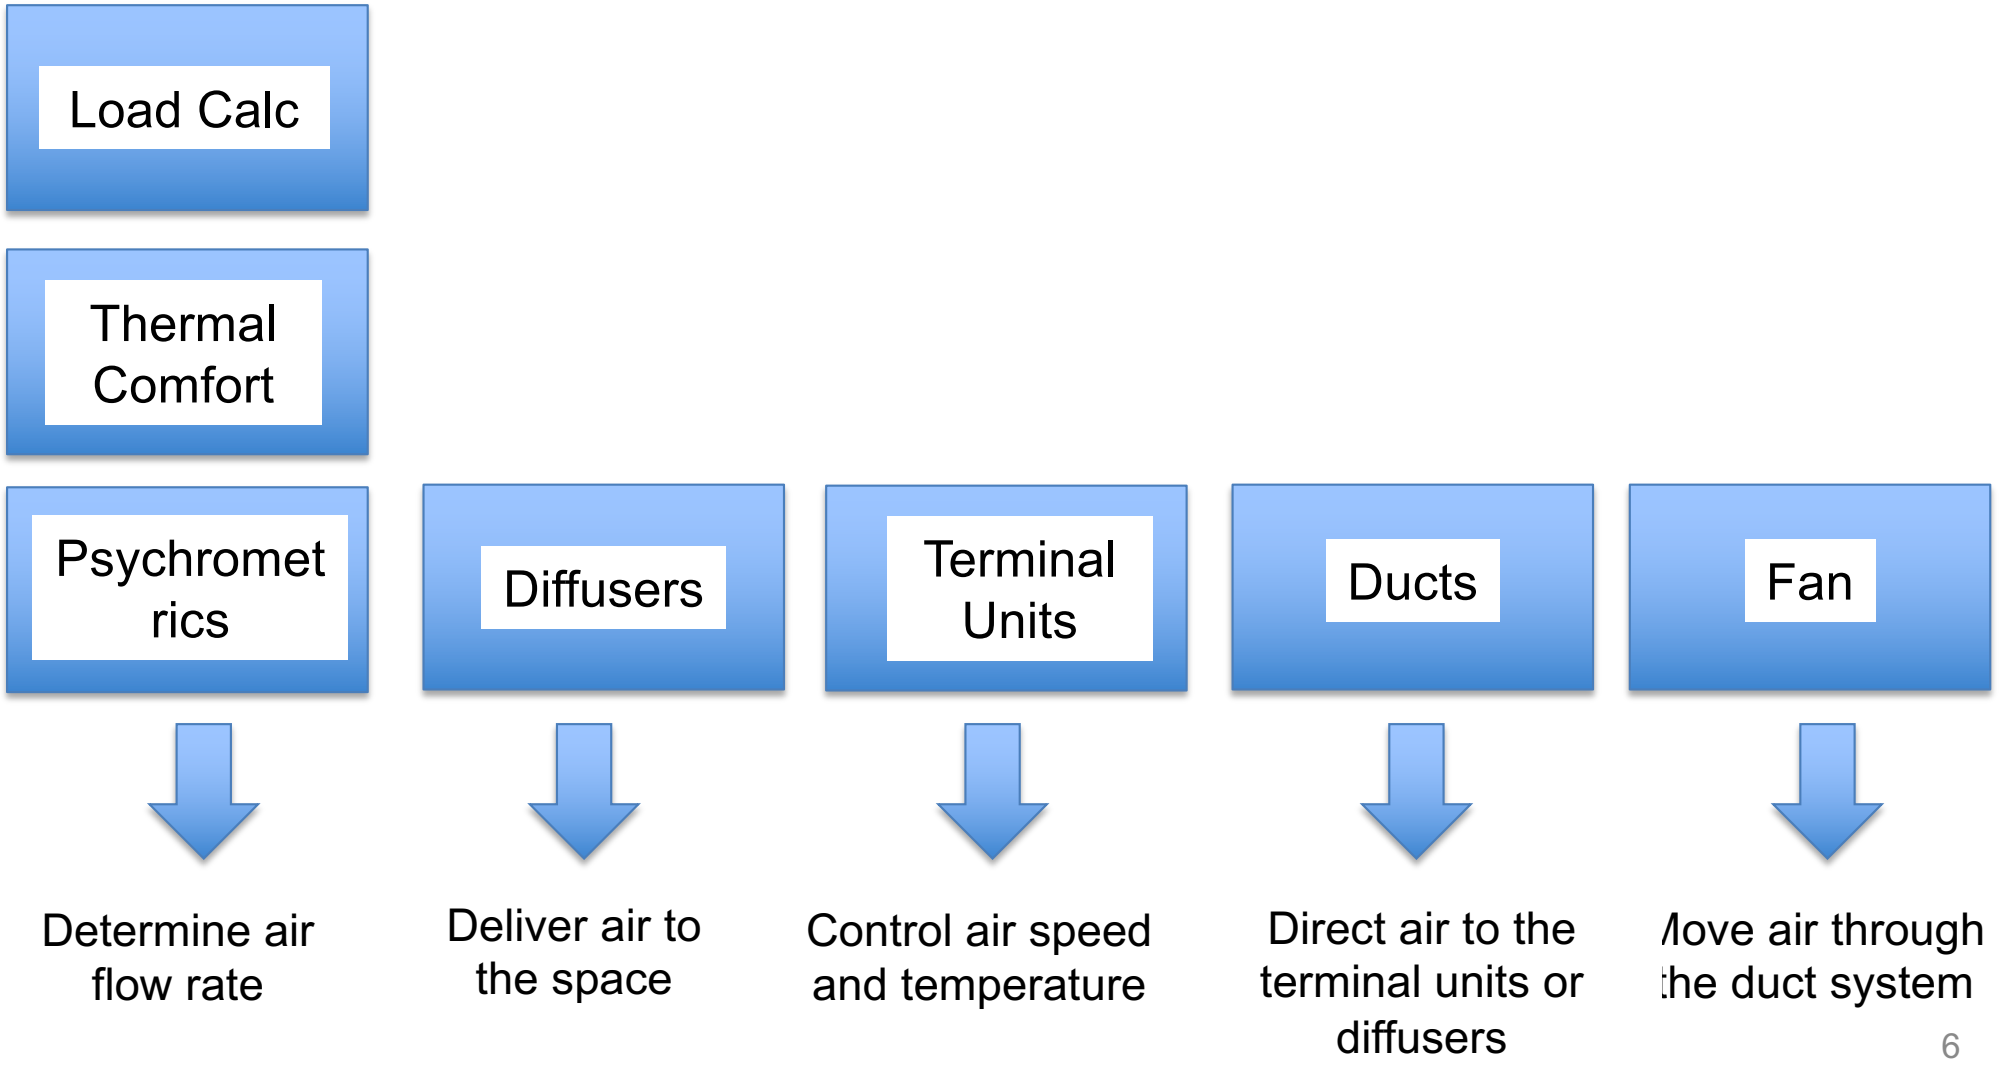
Lunch will be provided!

HOMEWORK / PROJECT / EXAM

RECAP

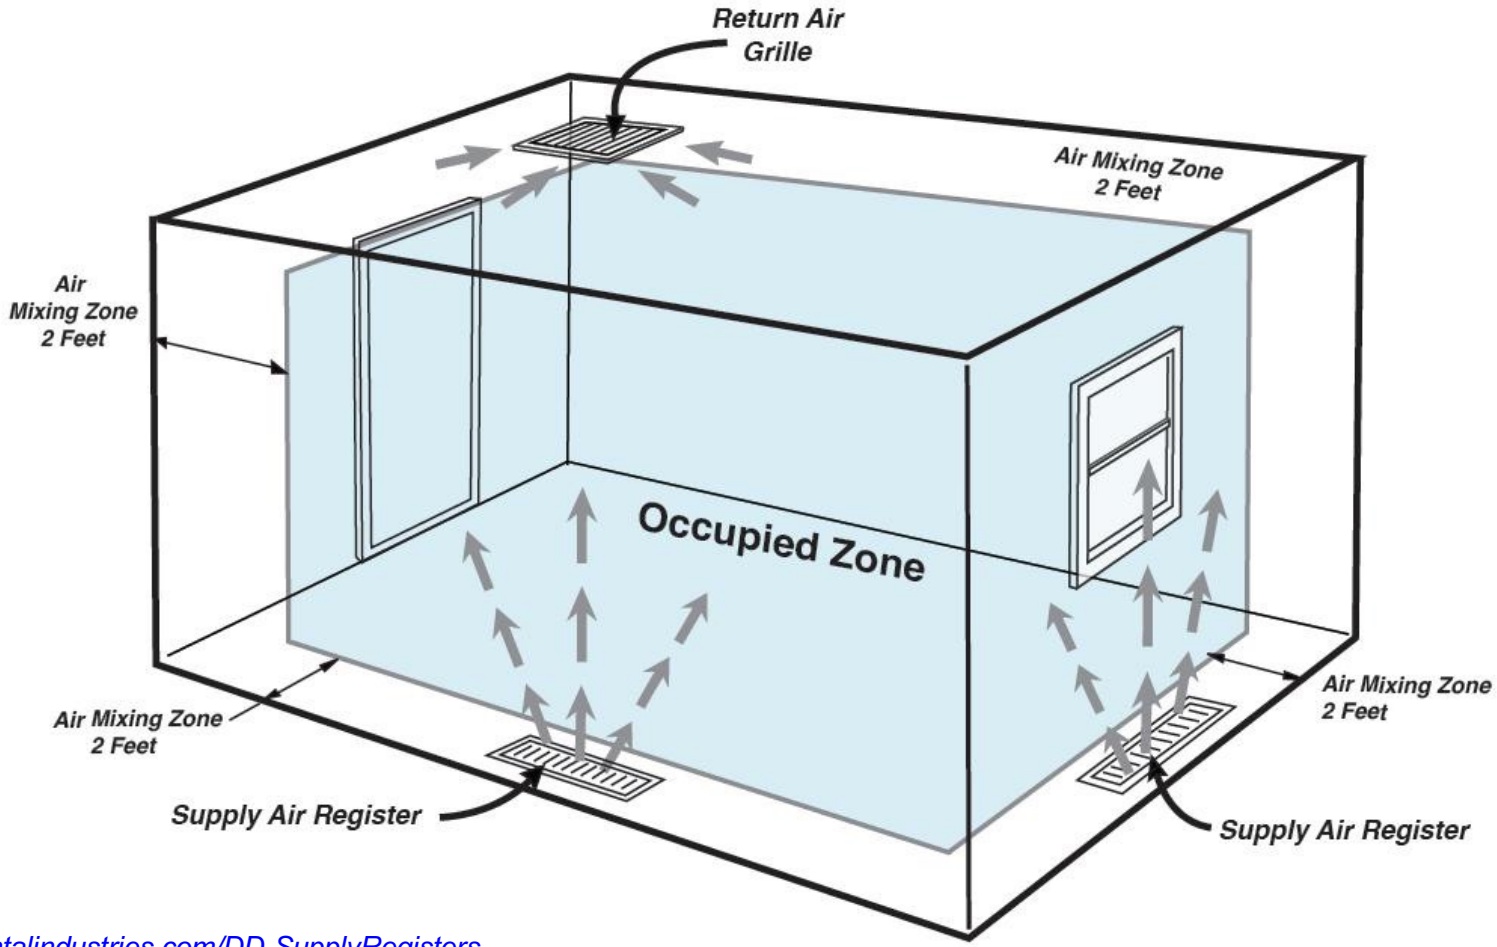
Recap

- There are a couple of components required for the design of an air distribution



Recap

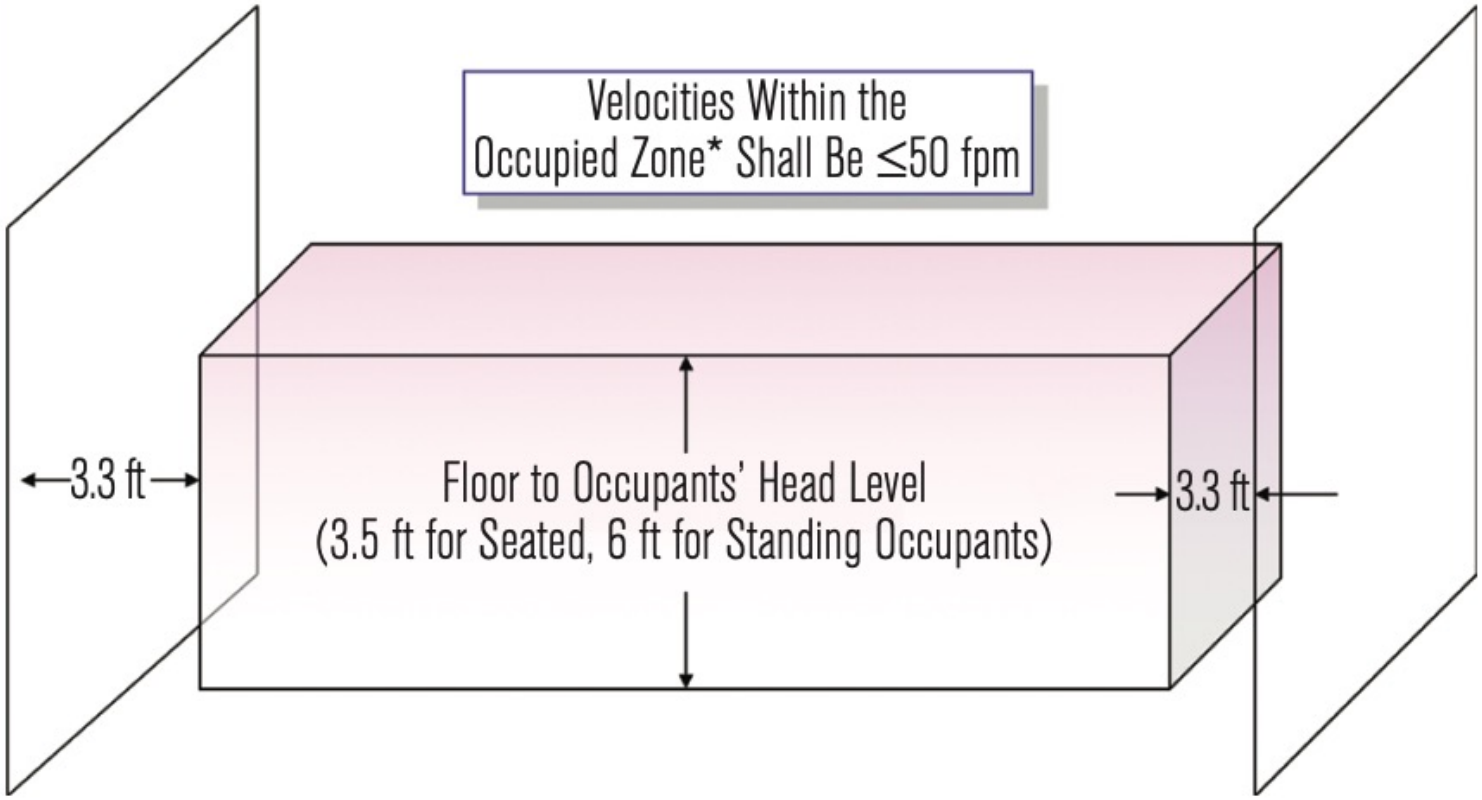
- We are interested in the occupied zone (or breathing zone):
  - ❑ 2 feet from any wall
  - ❑ 6 feet from the floor



https://www.continentalindustries.com/DD-SupplyRegisters

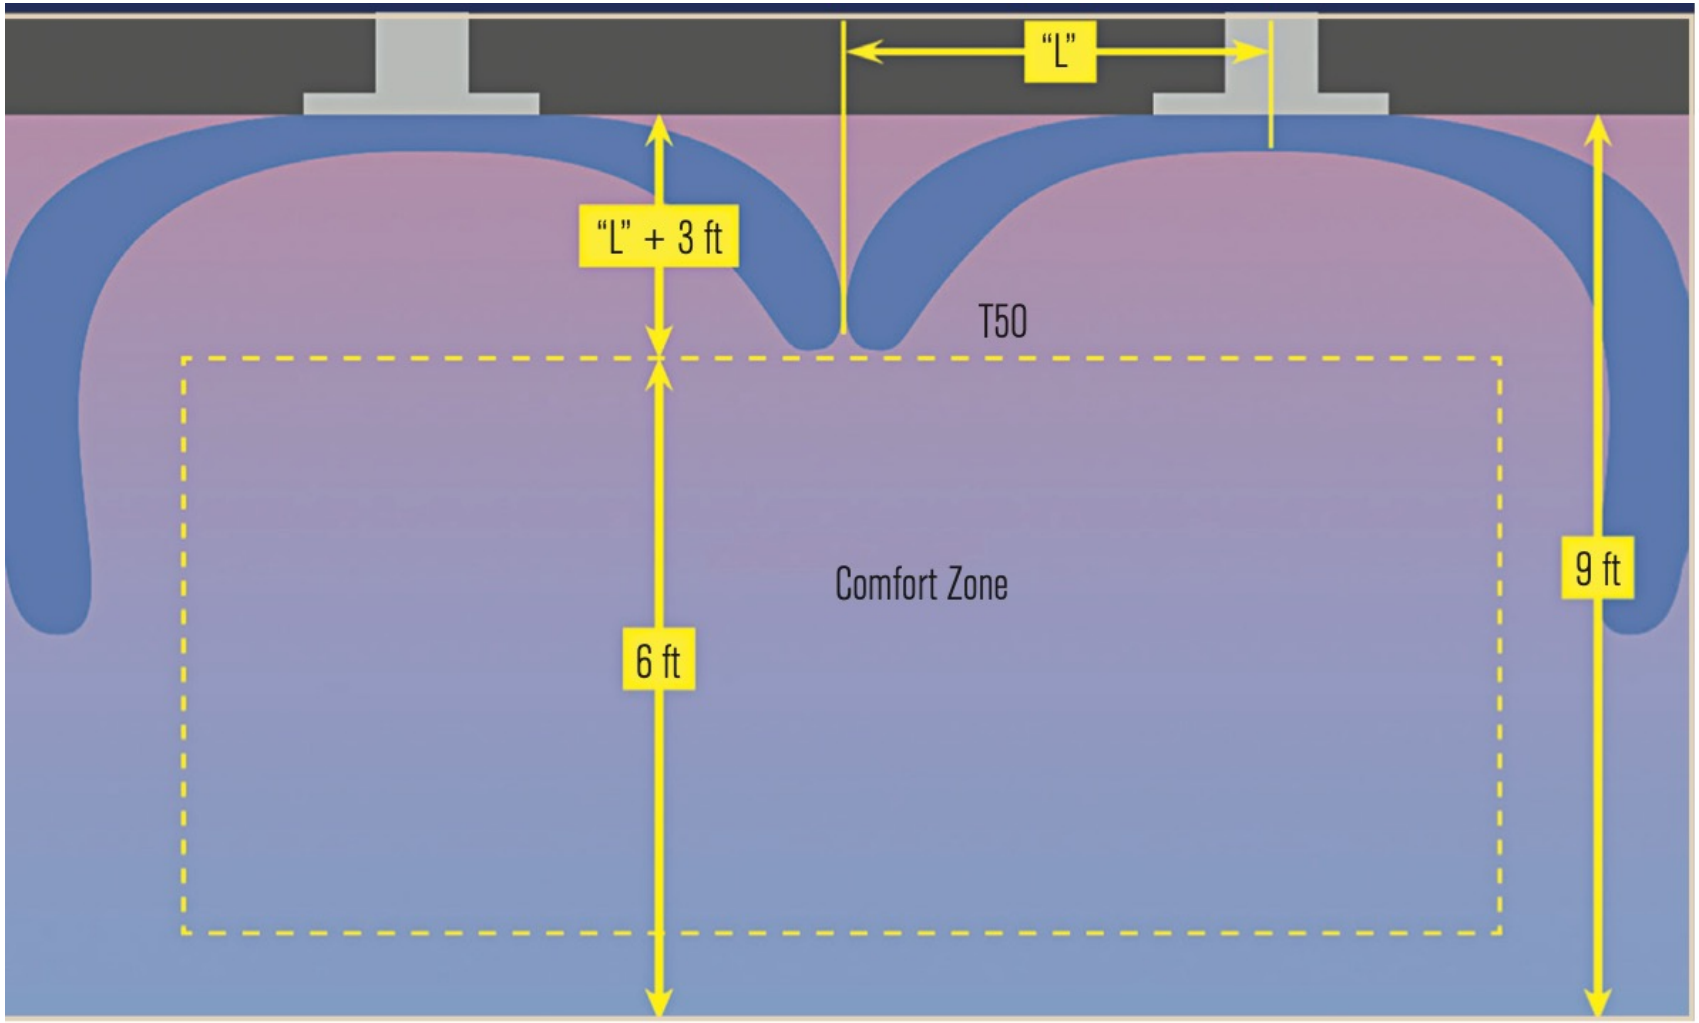
Recap

- The definition of the occupied zone can vary:



Recap

- The definition of the occupied zone can vary:



AIR DIFFUSION

Air Diffusion

Round ceiling diffuser

Square ceiling diffuser

Louvered face diffuser

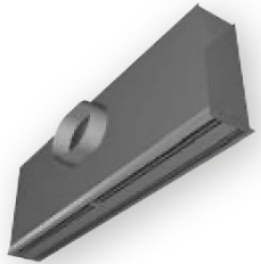
Round plaque diffuser

Square plaque diffuser

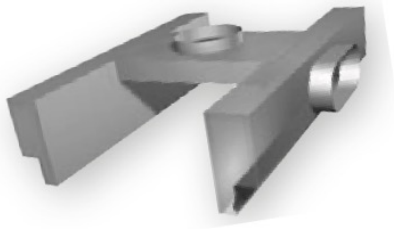
Perforated ceiling diffuse

Round Twist Diffuser

Plenum slot diffuser

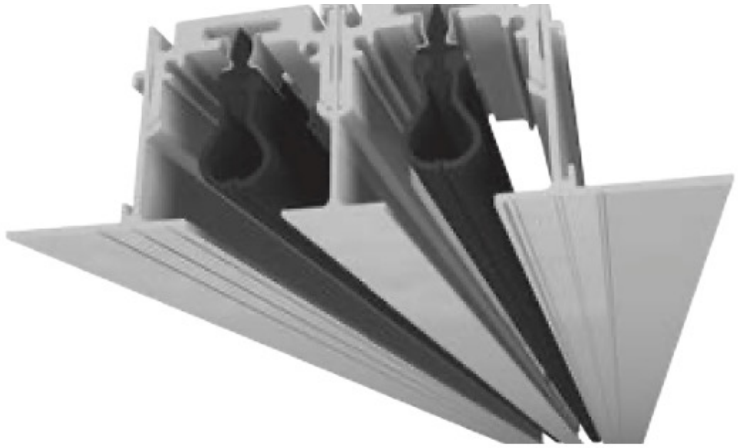


Light troffer diffuser



Engineering Guide Air Distribution, Price

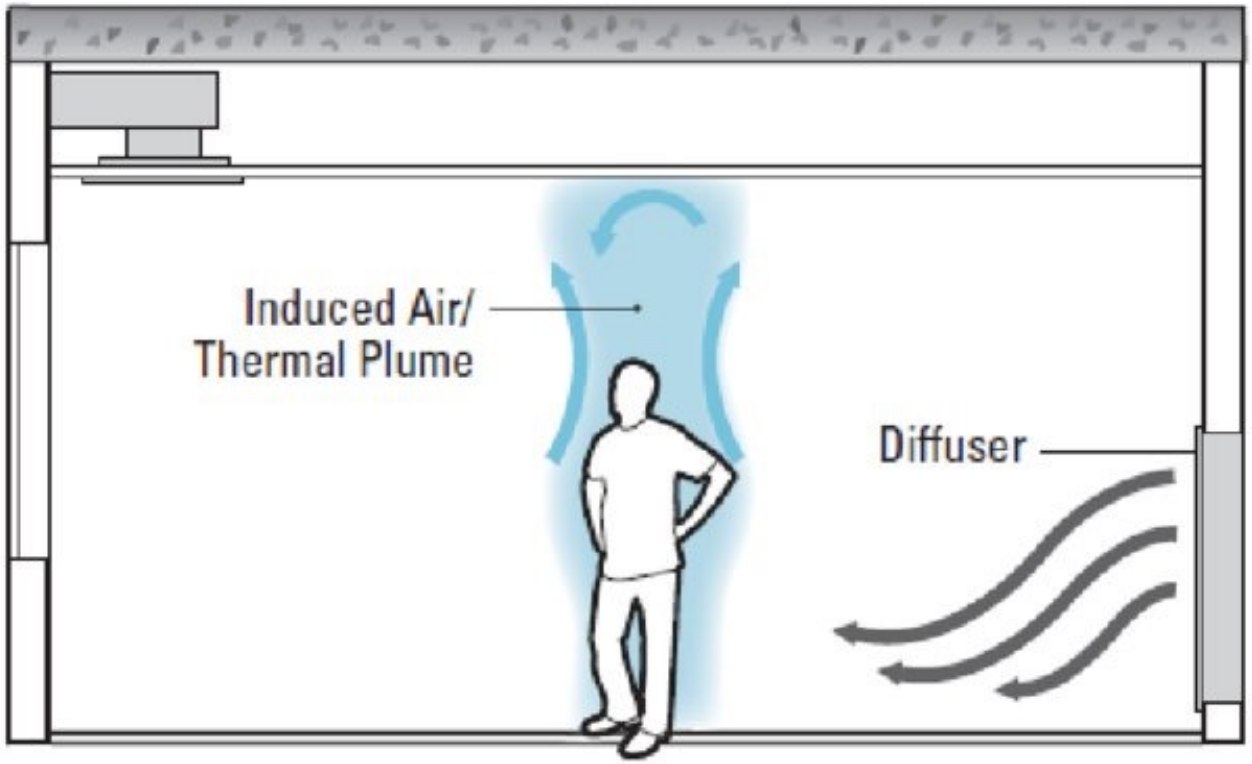
Air Diffusion



https://www.homedepot.com/p/Everbilt-8-in-x-8-in-4-Way-Square-Ceiling-Diffuser-EA504M-08X08/300539275 & http://www.acutherm.com/product/tlc-linear/. & Engineering Guide Air Distribution, Price
https://www.homeessentialsdepot.com/truaire-3-way-aluminum-square-ceiling-diffuser-8-in-x-8-in-3562230-3562230/?gclid=EAIaIQobChMIlJTpv7O24AIVBLnACh1SMwM9EAkYAiABEgKBqPD_BwE
http://grilletech.com.au/product/linear-slot-diffuser/

Air Diffusion

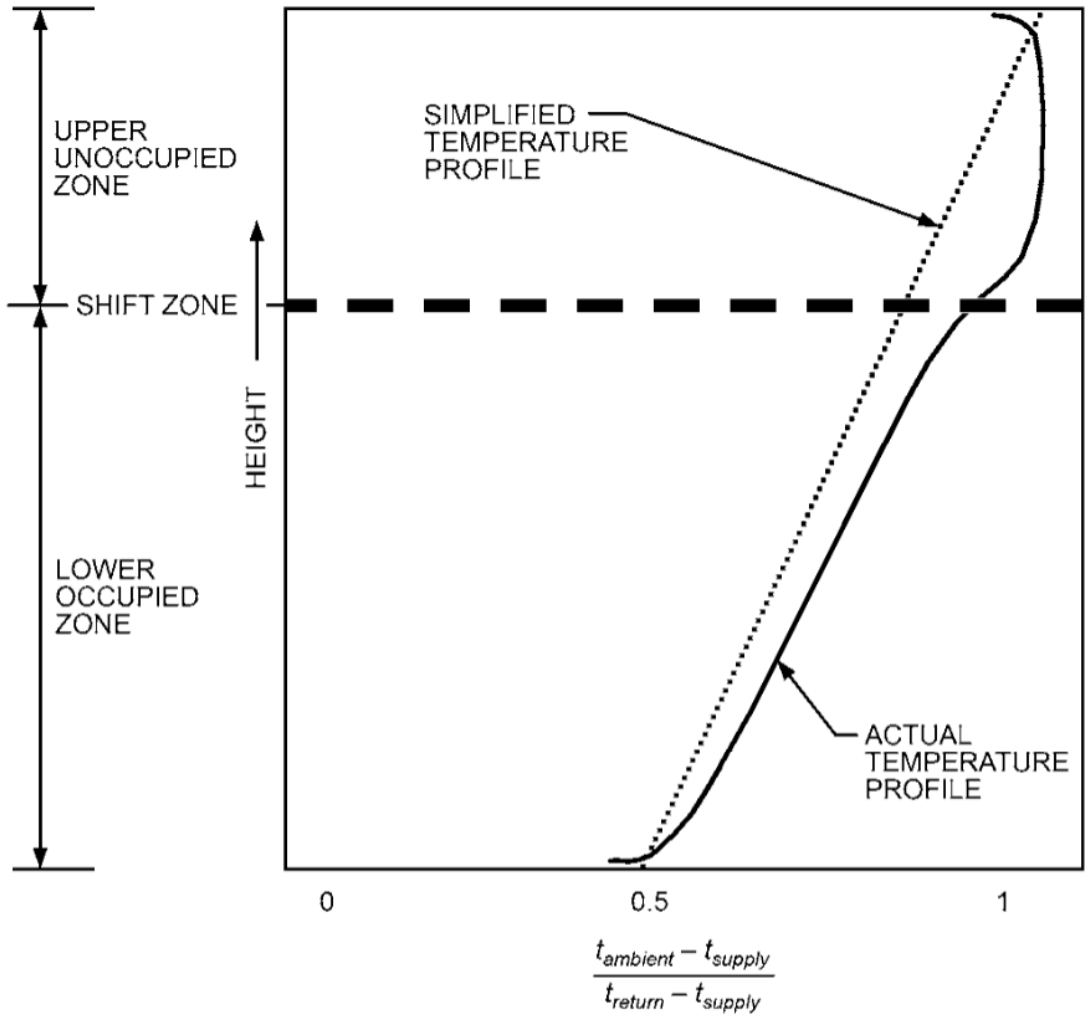
- Thermal Displacement Ventilation (TDV):
  - ❑ Introduce cool air into a space at low face velocities
  - ❑ Let convection and stratification move warm contaminated air up to returns



https://www.researchgate.net/publication/323471882_Alternatives_to_conventional_air_conditioning_systems_-_A_review/figures?lo=1

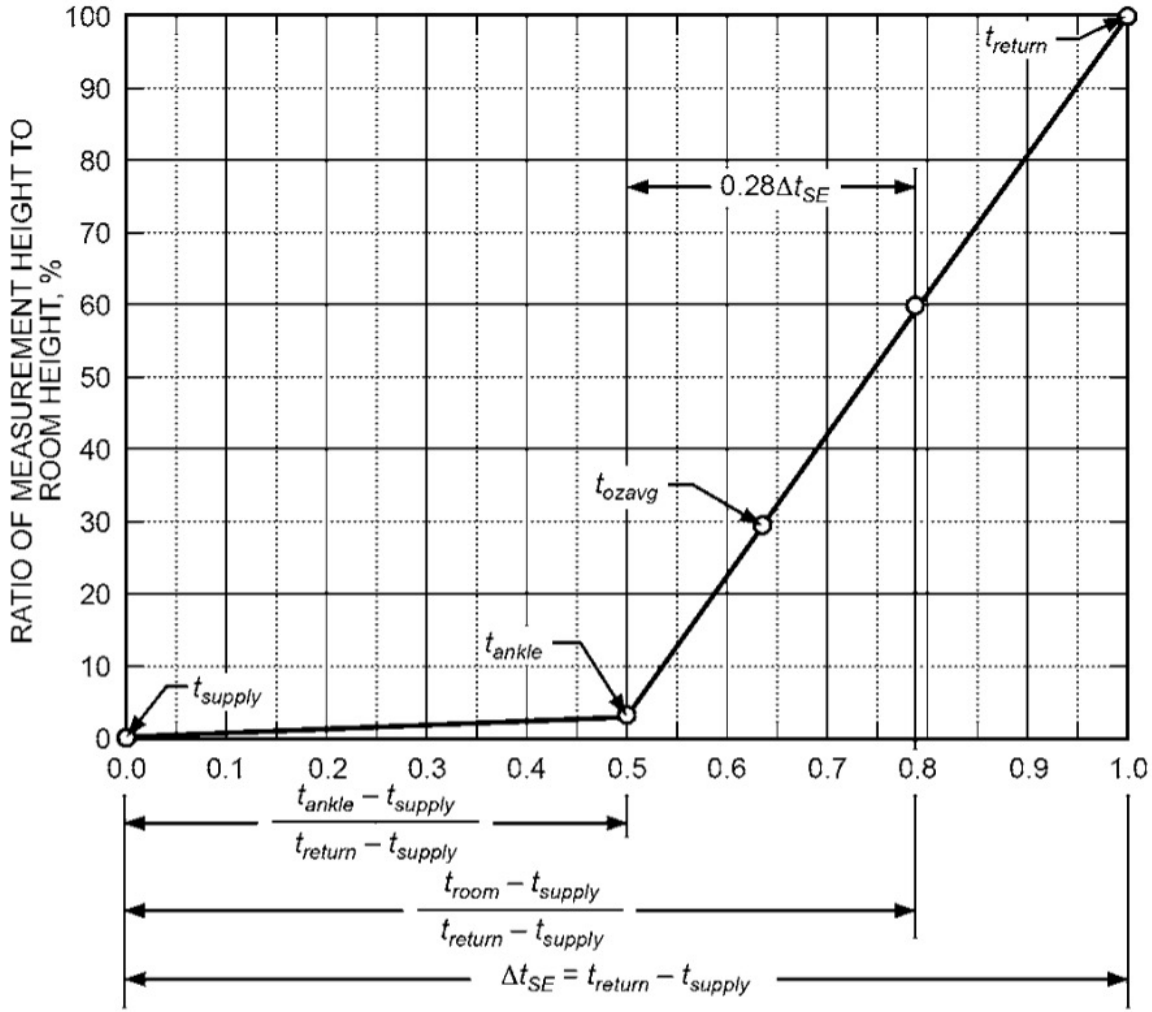
Air Diffusion

- Thermal Displacement Ventilation (TDV):
  - ❑ Temperature profile is usually as follow:



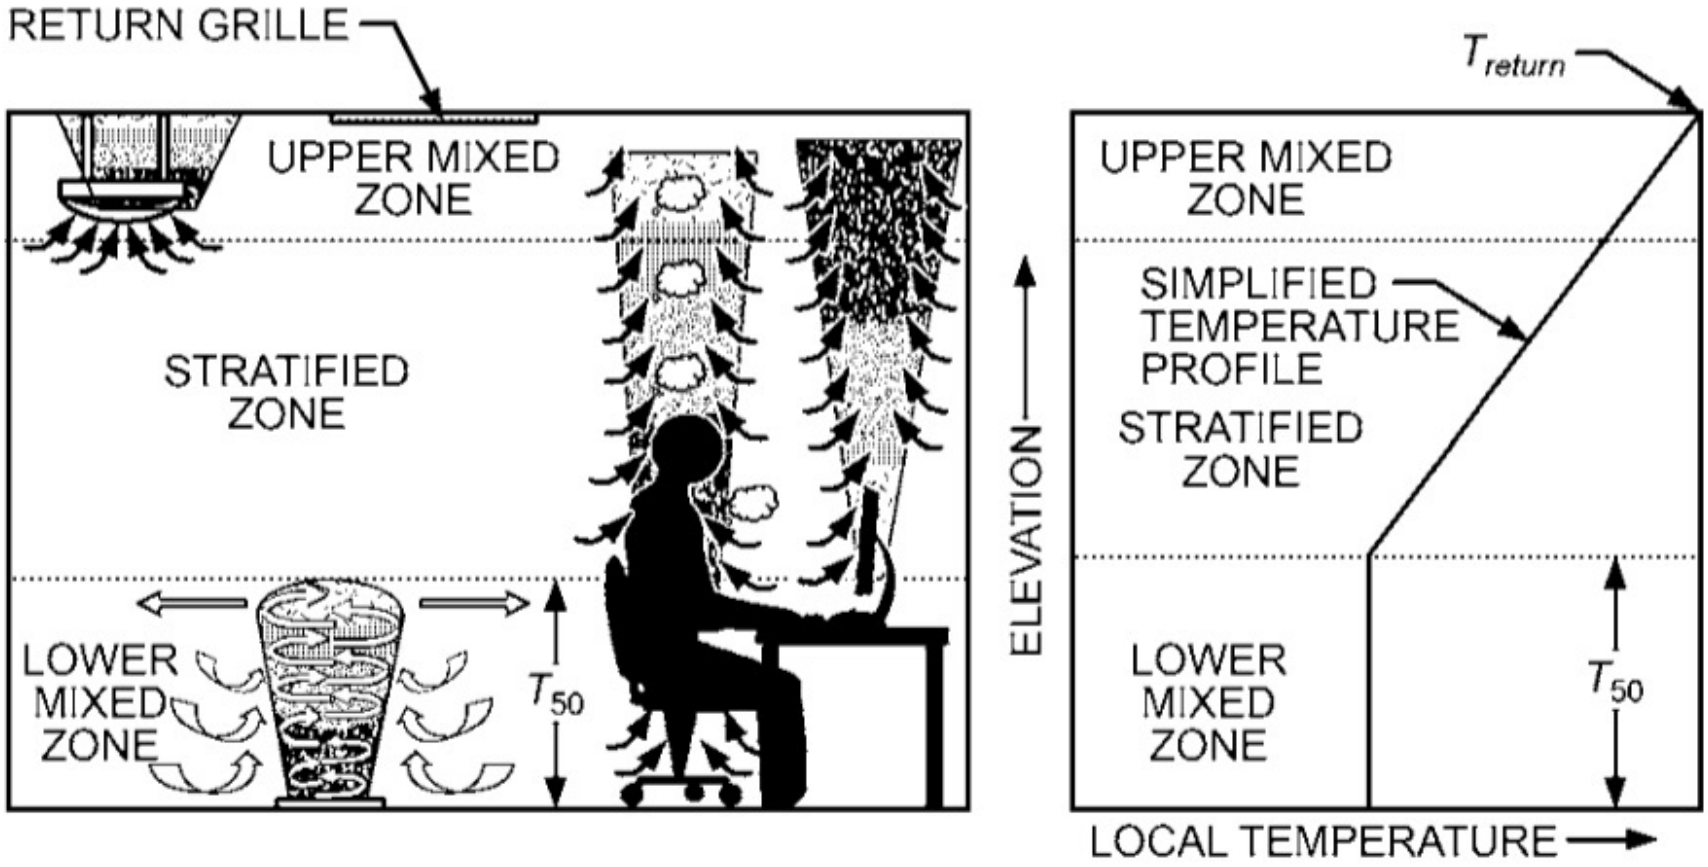
Air Diffusion

- Thermal Displacement Ventilation (TDV):
  - An example temperature profile for a ceiling height of 10 ft



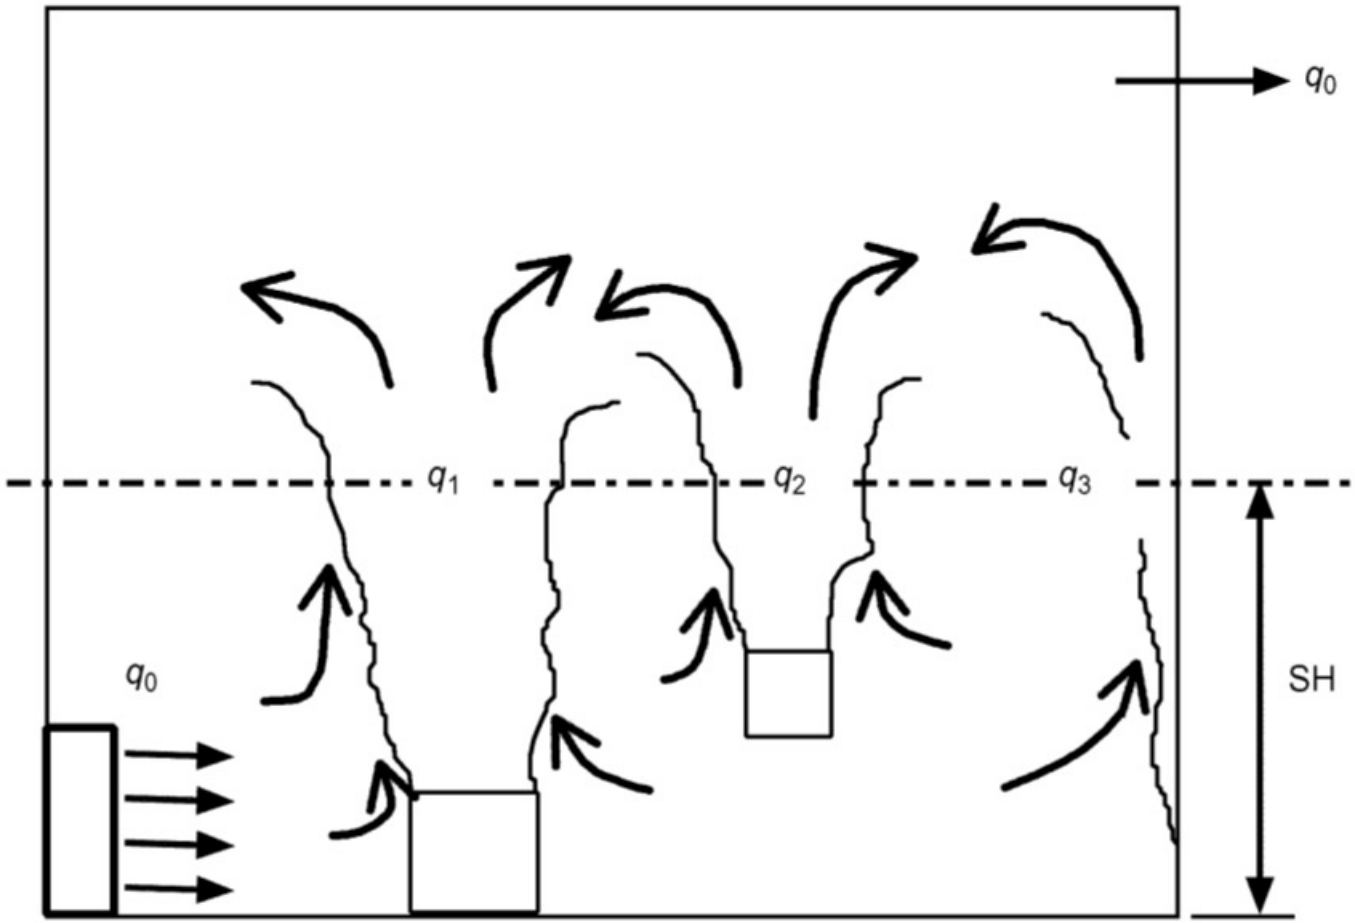
Air Diffusion

- Underfloor Air Distribution (UFAD):
  - ❑ Supply airflow is usually vertically at a relatively high velocity



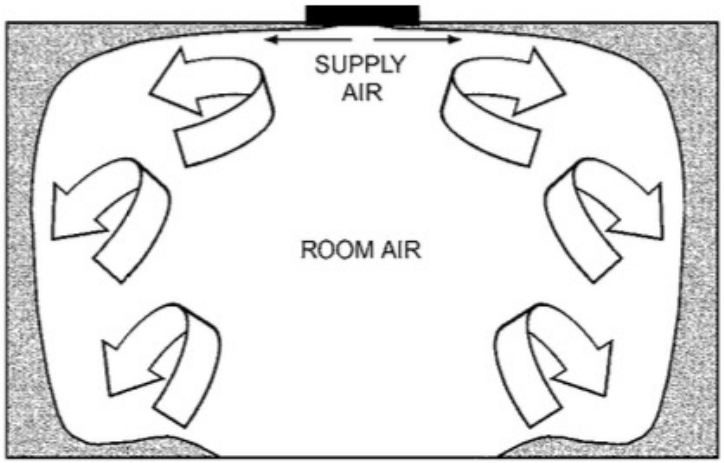
Air Diffusion

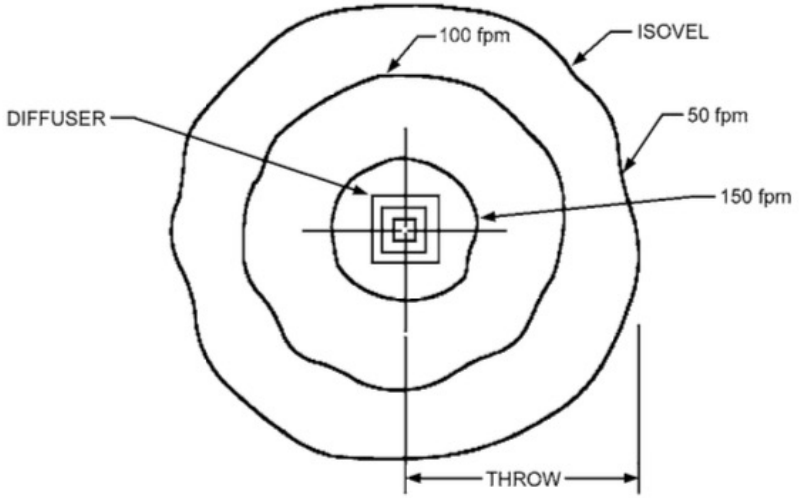
- We need to make sure to consider internal objects



Air Diffusion

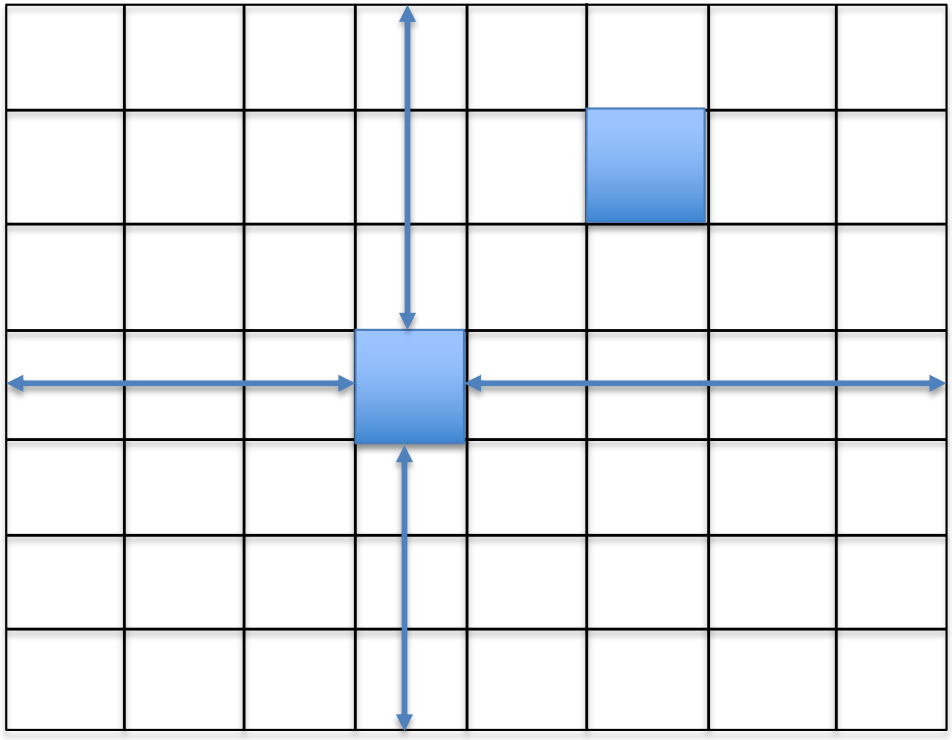
- Remember the secondary flow is important





Air Diffusion

- To identify the characteristics length, we need to identify the location of the air outlets
- Identify the maximum achievable throw:



Air Diffusion

High Sidewall Grille

Distance to wall perpendicular to jet

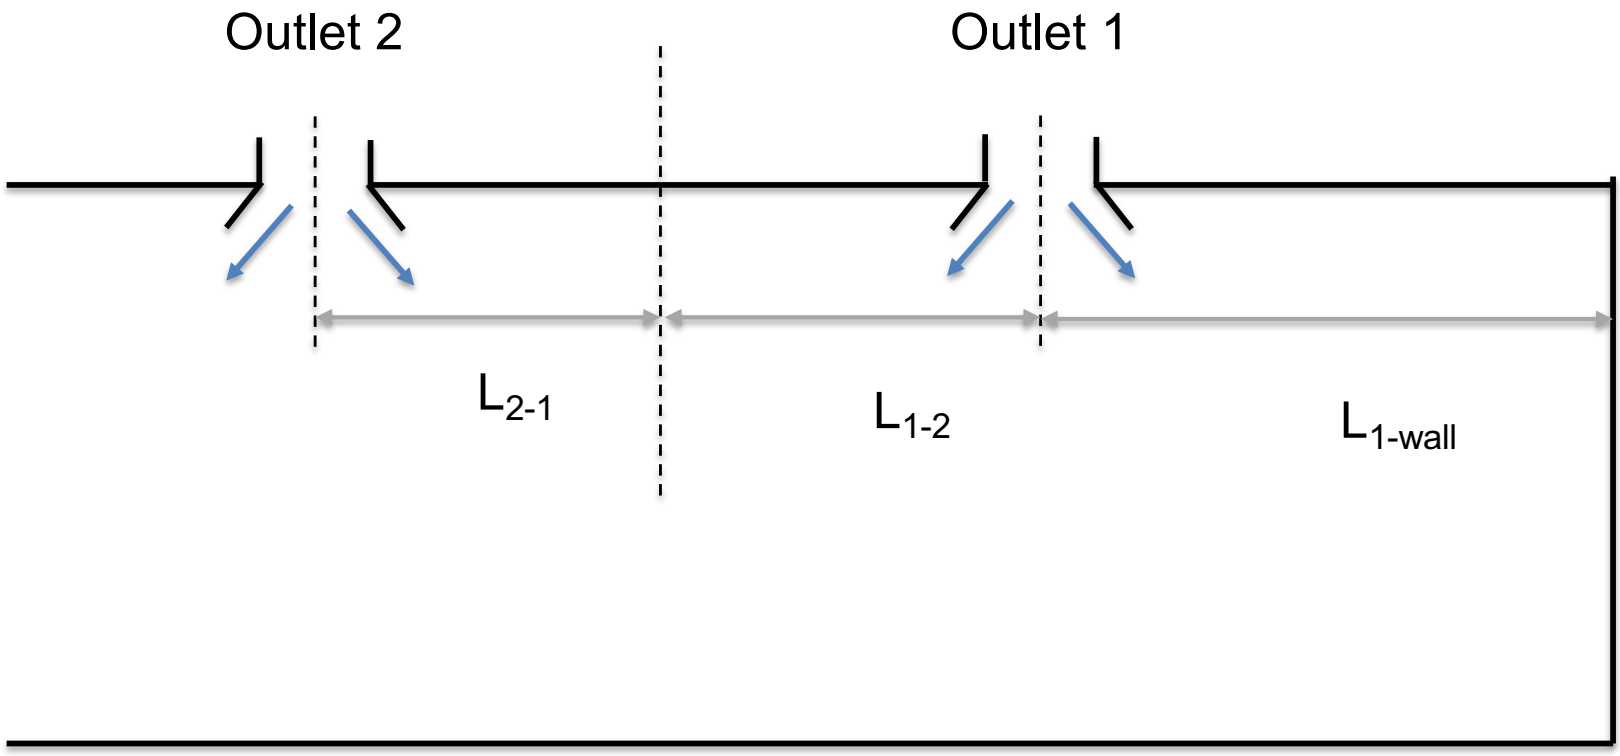
Circular Ceiling Diffuser

Distance to closet wall or intersecting air jet

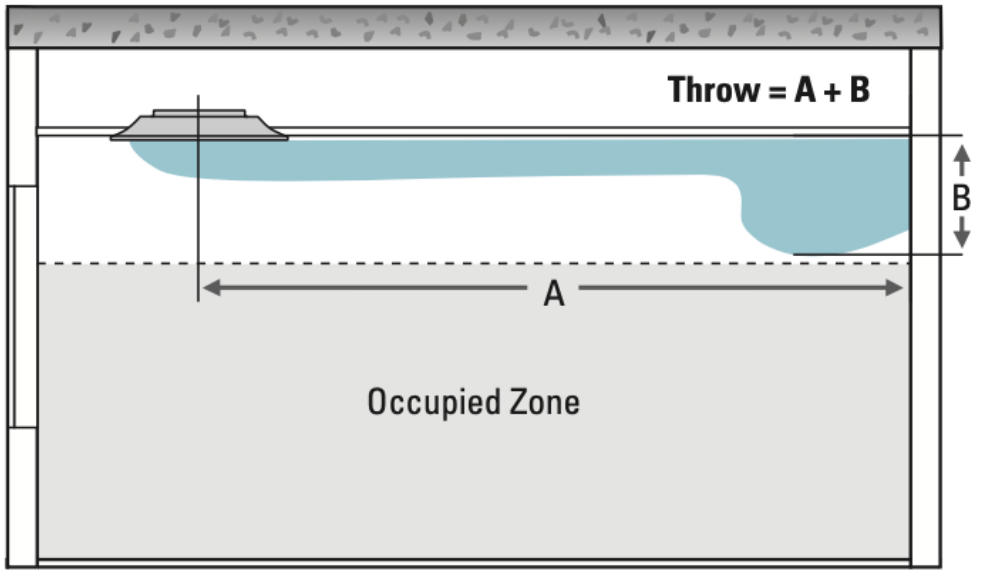
https://www.zoro.com/zoro-select-sidewallceiling-register-adjustable-. &. http://www.airmate.com/products/rezzin-round/ceiling-diffuser
4mjk6/i/G3228687/featureproduct?gclid=CjwKCAiA767jBRBqEiwAGdAOr9PLHqDn6n9EPQA_dt52anSd56Ufjsi01C2Y1uw7d1UgBStCgclyPBoCYdUQAvD_BwE

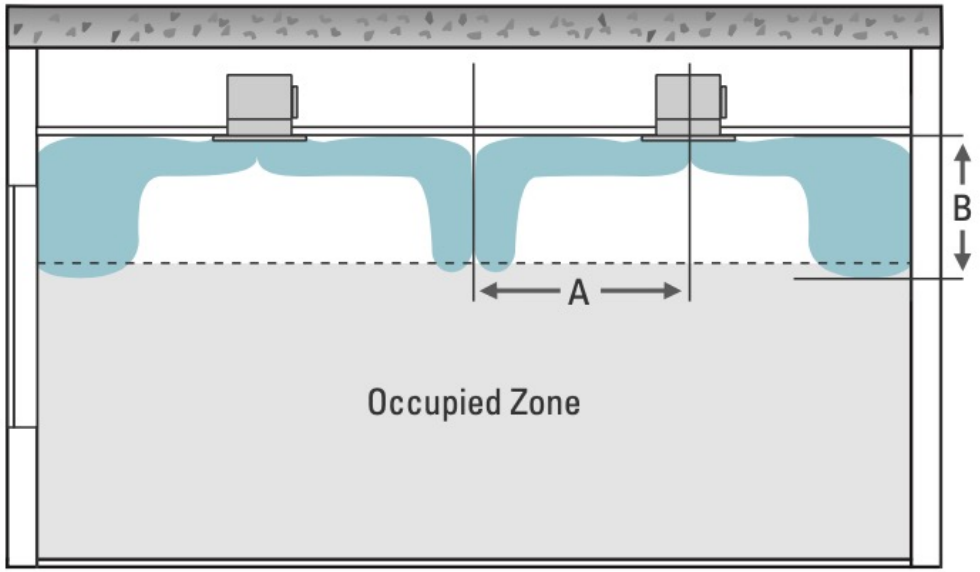
Air Diffusion

- The available length (L) for outlet #1 is the lesser of $L_{1\text{-wall}}$ and $L_{1\text{-}2}$ for this case



Air Diffusion

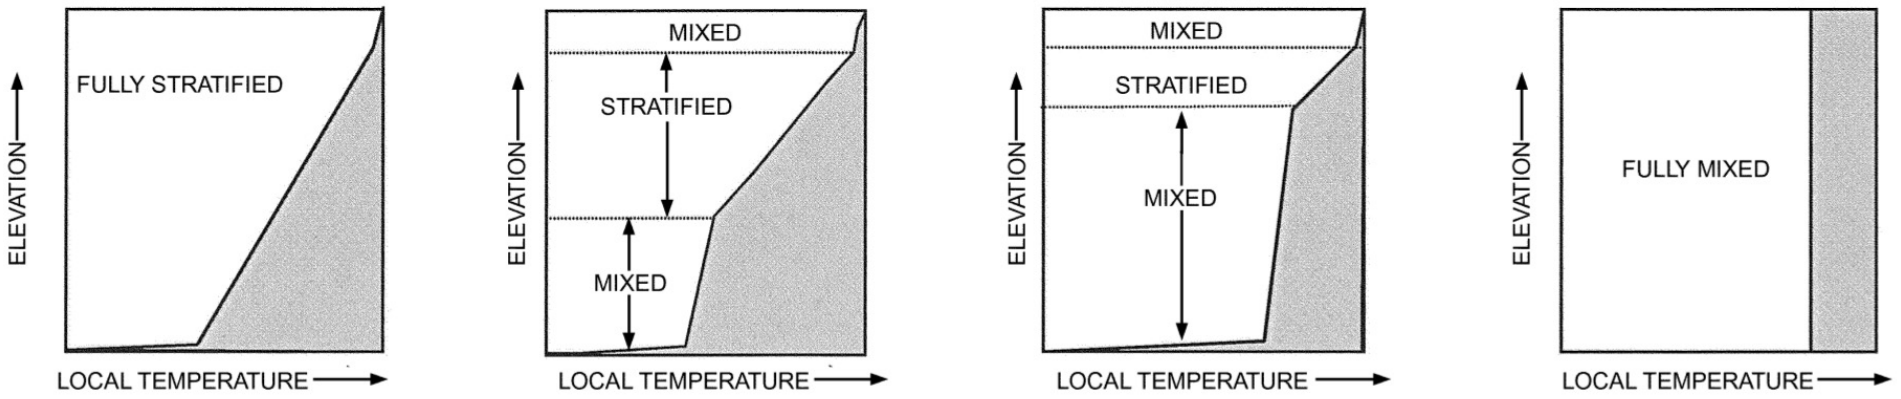




Engineering Guide Air Distribution, Price

VERTICAL TEMPERATURE STRATIFICATION PROFILES

Vertical Temperature Stratification Profiles



PARTIALLY MIXED ROOM AIR DIFFUSION METHODS

FULLY STRATIFIED ROOM AIR DISTRIBUTION SYSTEMS

FULLY MIXED ROOM AIR DISTRIBUTION SYSTEMS

EXAMPLES:

- Thermal displacement using low-velocity cool air
- Natural ventilation

EXAMPLES:

- Underfloor air distribution (using room air induction) in cooling operation
- Underseat air distribution (using room air induction) in cooling operation
- Task/ambient cooling (using furniture-based outlets)
- Task/ambient (spot) cooling or heating (industrial applications)

EXAMPLES:

- Overhead mixed air supply in cooling operation
- Fan-coil units and unit ventilators
- High-velocity floor-based supply in heating operation

Vertical Temperature Stratification Profiles

- Fully mixed systems: Room air is fully mixed
  - ❑ Little or no thermal/pollutant stratification vertically
  - ❑ Achieved by supplying large amounts of conditioned air into the room either from overhead or underfloor
  - ❑ Conditioning of the space achieved by diluting space air with the supply air
  - ❑ Overhead air distribution is an example of this distribution

Vertical Temperature Stratification Profiles

- Fully stratified systems: Space is fully stratified vertically
  - ❑ There is a distinct thermal gradient
  - ❑ Happens through the displacement ventilation systems

Vertical Temperature Stratification Profiles

- Partially mixed systems:
  - ❑ This arises when the occupied space is fully mixed and maintained at a condition distinctly different from the unoccupied zone
  - ❑ The unoccupied volume is usually stratified into three zones whose relative lengths may vary
  - ❑ Most underfloor air distribution systems (UFAD) are examples of this type

CLASSIFICATION OF AIR DIFFUSION METHODS

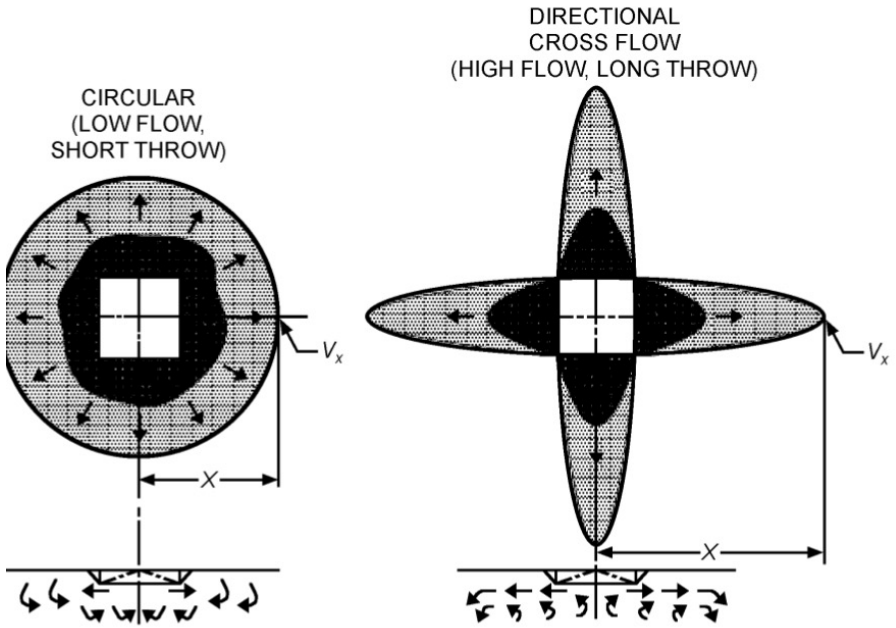
Outlet Classification

- Group A
  - Outlets mounted in or near the ceiling that discharge air horizontally
  - Outlets discharge horizontally the air that is not influenced by an adjacent surface
- Group B
  - Outlets mounted in or near the floor that discharge air vertically in a non-spreading jet
- Group C
  - Outlets mounted in or near the floor that discharge air vertically in a spreading jet
- Group D
  - Outlets mounted in or near the floor that discharge air horizontally
- Group E
  - Outlets that project supply air vertically downward

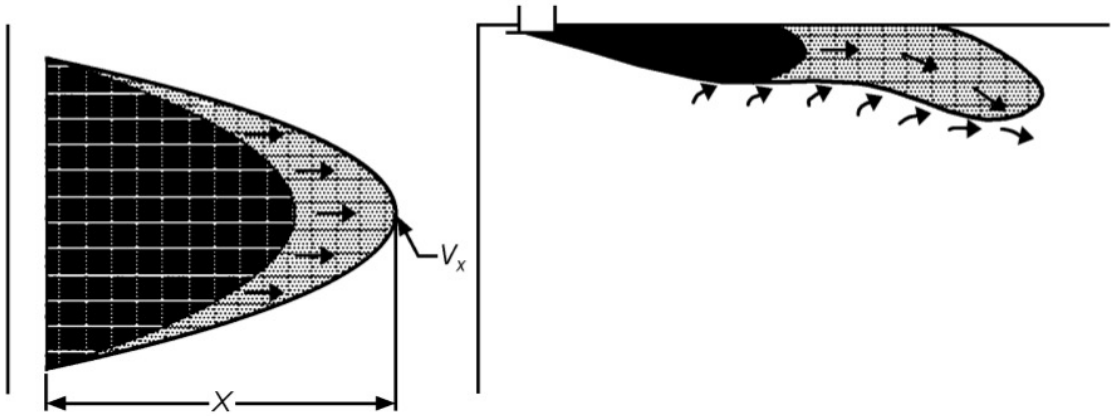
Group A1 (Ceiling: Horizontal Discharge)

- High sidewall grilles
- Sidewall diffusers
- Ceiling diffusers
- Linear ceiling diffusers

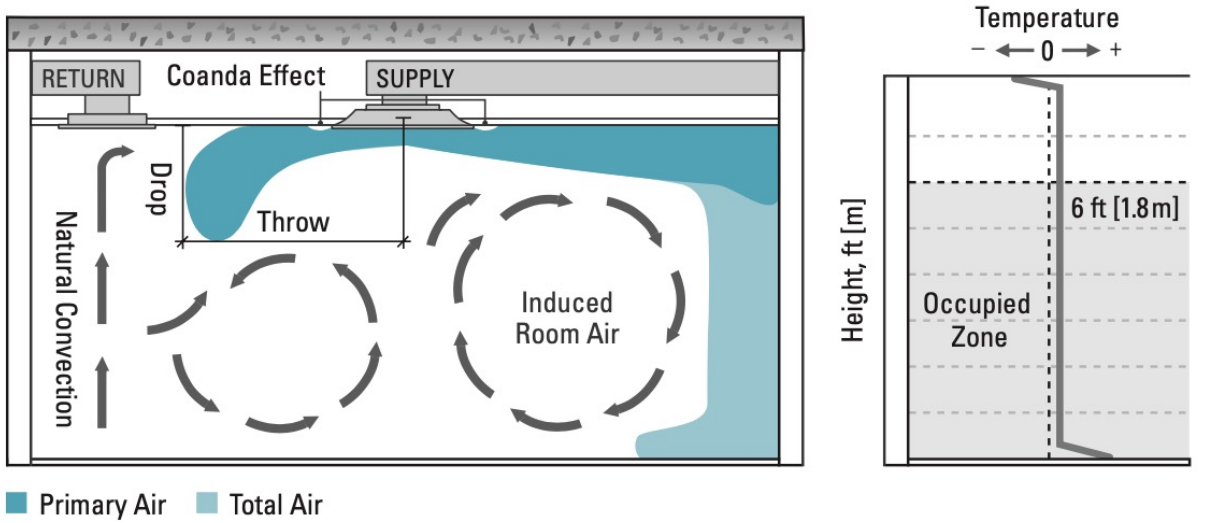
Group A1 (Ceiling: Horizontal Discharge)

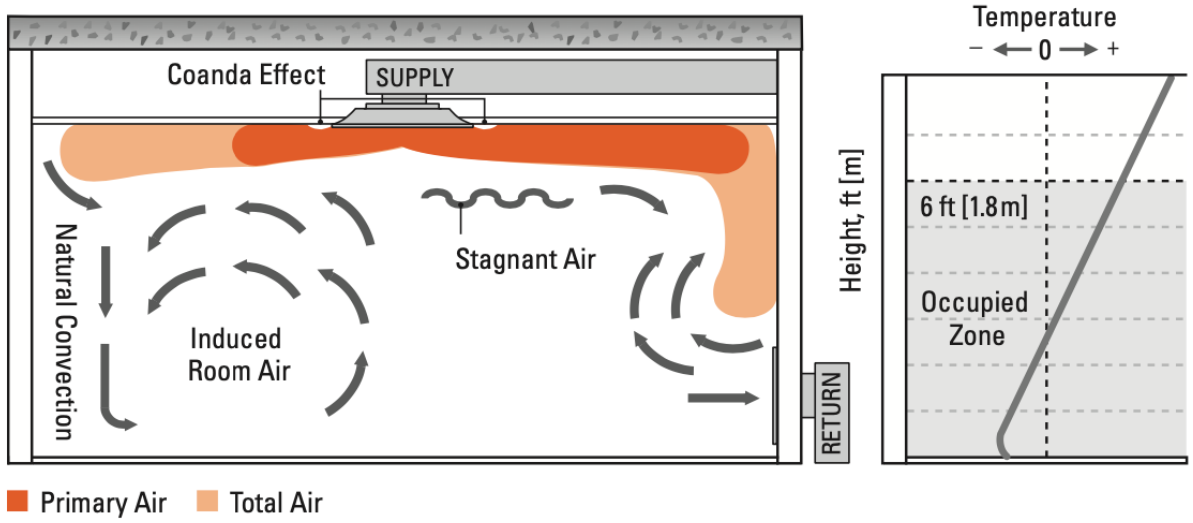


Non-Isothermal



Group A1 (Ceiling: Horizontal Discharge)



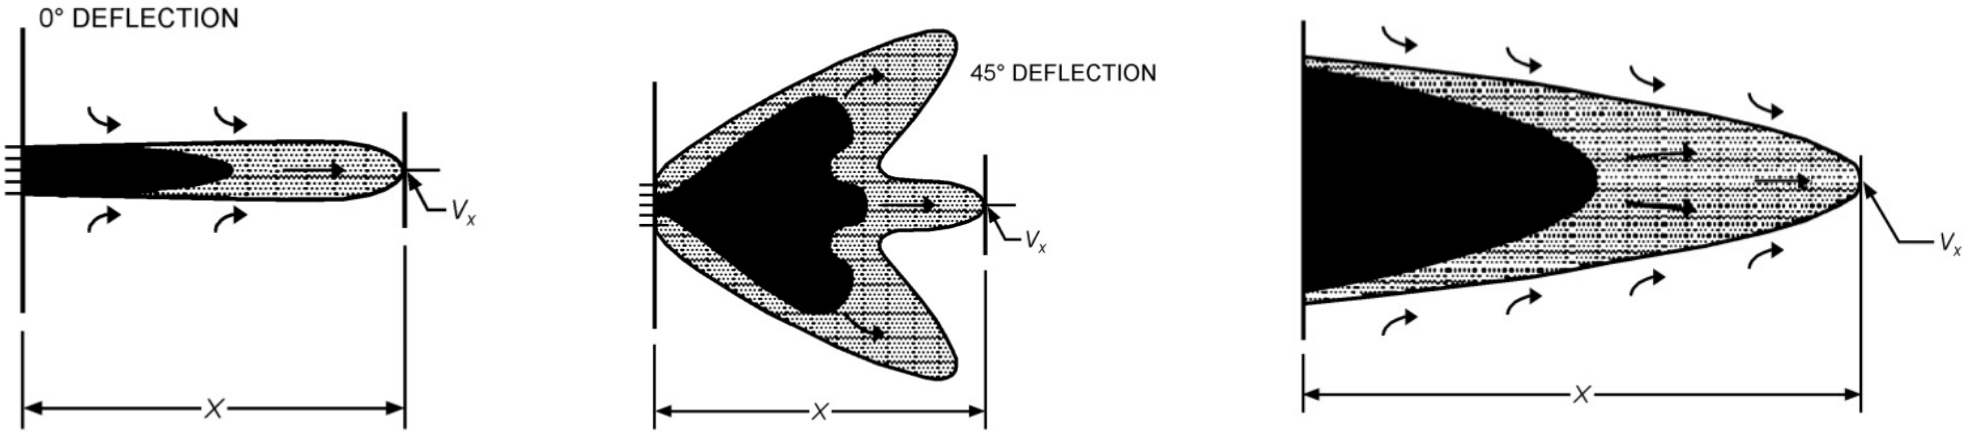


What do you think any of these configurations are good for heating or cooling?

Engineering Guide Air Distribution, Price

Group A2 (Horizontal Discharge Not Surface)

- Similar to A2 with higher stratification for the cooling close to the ceiling



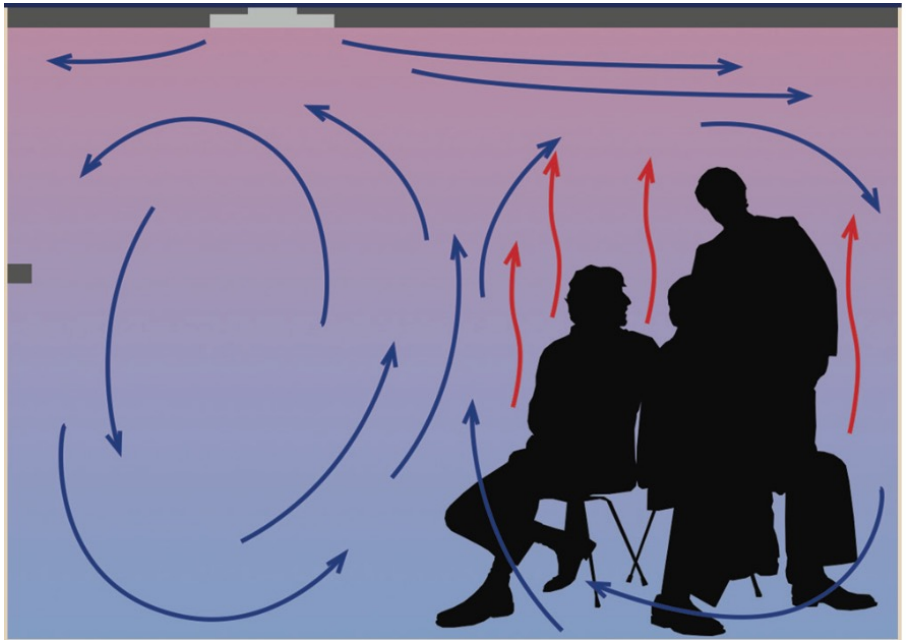
Group A (Ceiling: Horizontal Discharge)

- Often used in mild climates and on the second and succeeding floors of multistory buildings
- Not recommended for cold climates or with unheated floors
- Because the primary air project radially in all directions, the rate of entrainment is large, causing the high-momentum jet to diffuse quickly
- Ceiling diffuser allow handling larger quantities of air at higher velocities than other types

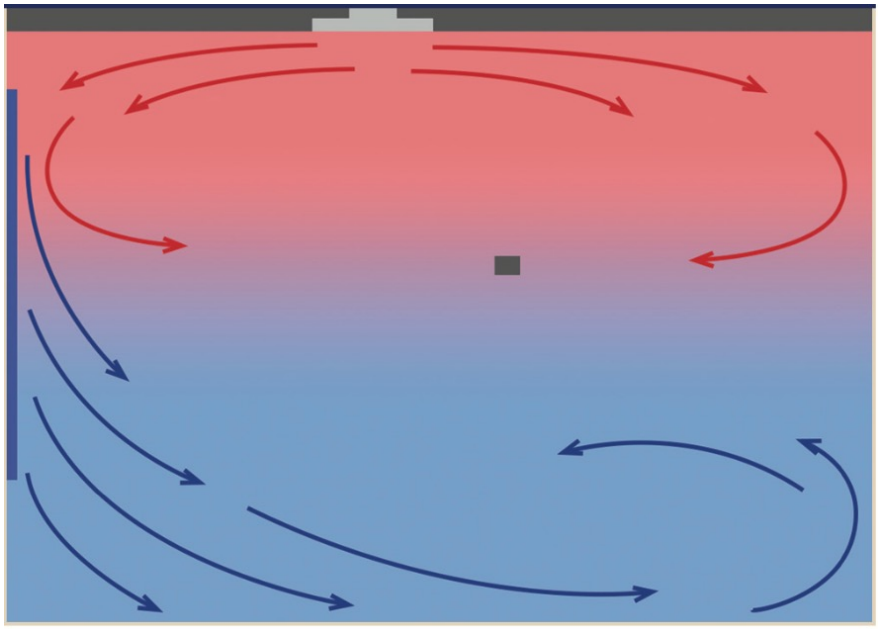
Group A (Ceiling: Horizontal Discharge)

- Quite effective for cooling
- Not recommended for heating unless the floor is above a heated space
- Linear diffusers fall into this group
  - ❑ Good for cooling
  - ❑ Require a supplemental heating system

Group A (Ceiling: Horizontal Discharge)

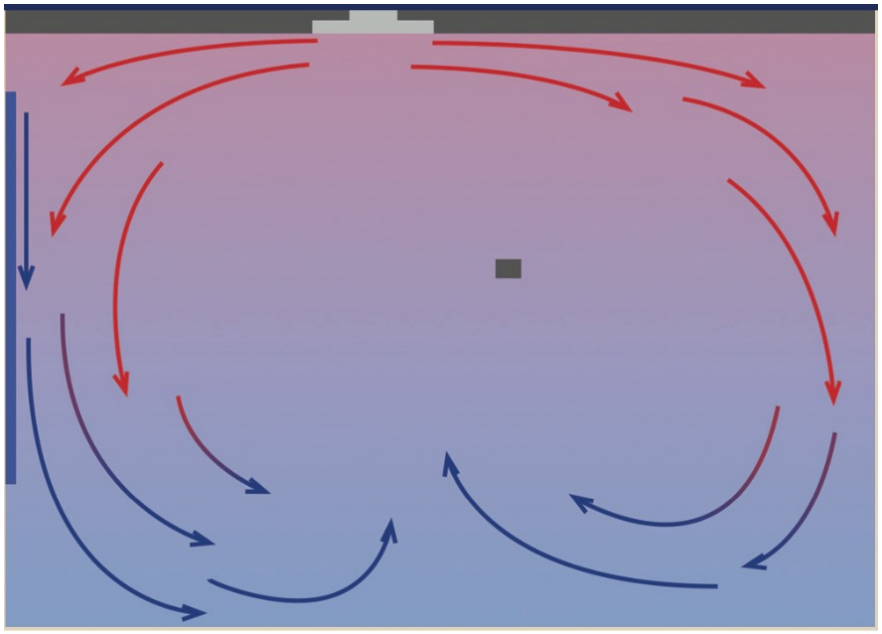


Group A (Ceiling: Horizontal Discharge)



$\Delta T > 15$ °F (8.3°C)

$V \sim 150\ fpm\ (0.75\ \frac{m}{s})$



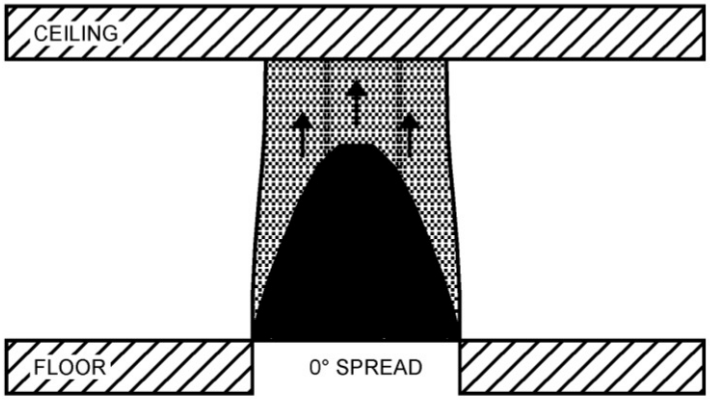
$\Delta T < 15$ °F (8.3°C)

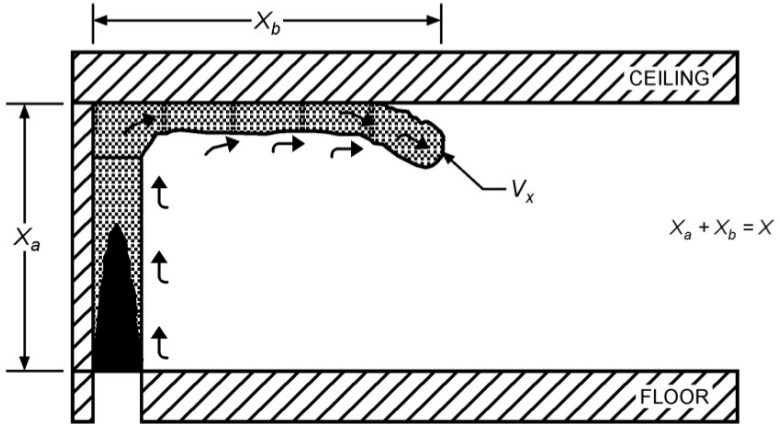
Group B (Vertical Discharge – Non spreading)

- Floor registers
- Baseboard units
- Low sidewall units
- Linear type grilles

Group B (Vertical Discharge – Non spreading)

- Satisfactory performance for cooling
- Less desirable for heating because a larger stratified zone will usually occur





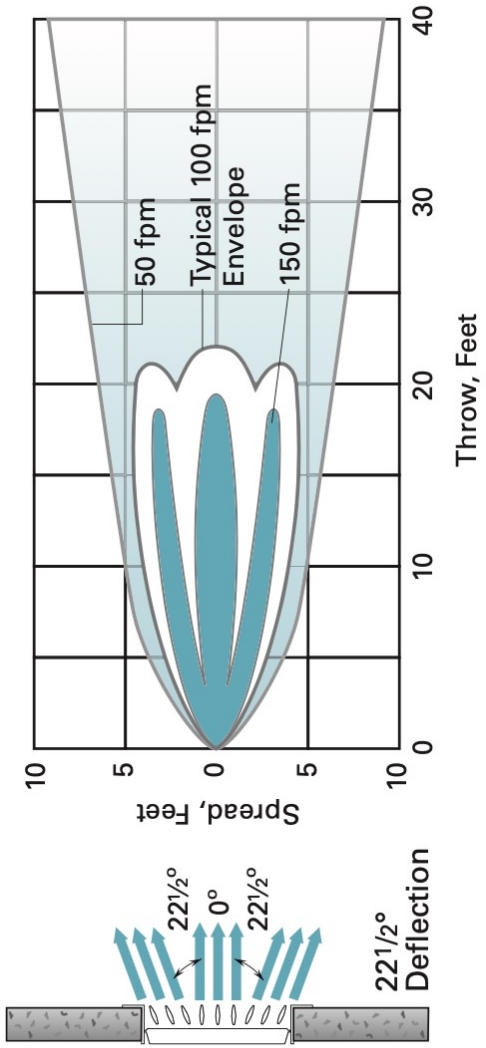
Outlet in or near floor, non spreading linear jets

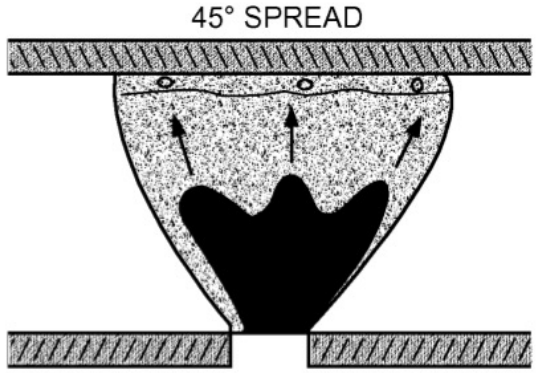
4ºF (2ºC) Acceptable to 85% of occupants

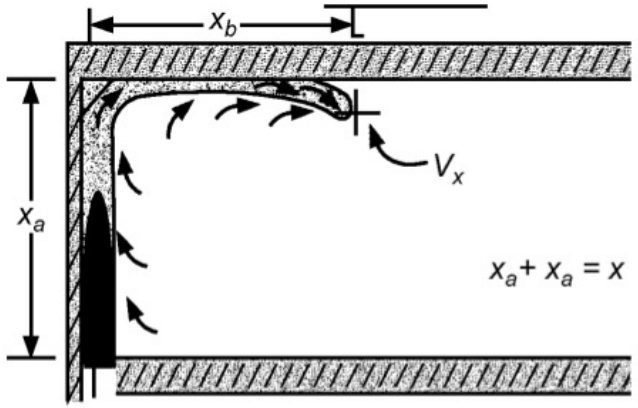
Group C (Vertical Discharge –spreading)

- Floor diffusers
- Sidewall diffusers
- Linear type diffusers

Group C (Vertical Discharge –spreading)







Engineering Guide Air Distribution, Price

Group C (Vertical Discharge –spreading)

https://www.titus-hvac.com/image/5EA02474-A2E8-476D-982D-8F1333BB8D7F

Group C (Vertical Discharge –spreading)

- Usually assume superior for heating applications, especially:
  - ❑ The floor is located over an unheated space or a slab
  - ❑ Considerable glass area exists in the wall

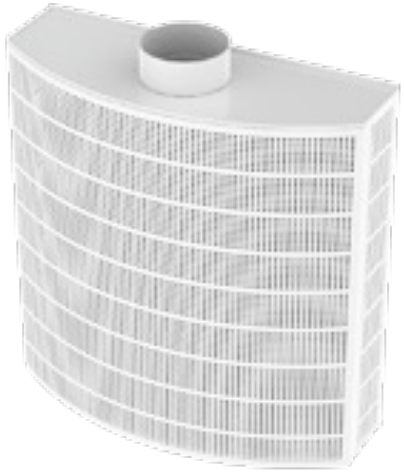
- Diffusers with a wide spread are usually best for heating because buoyancy tends to increase the throw

- Similarly, these diffusers are not good for cooling application because the throw may not be adequate for mixing

- Sometimes diffusers are available to change depending on the season

Group D (Horizontal Discharge)

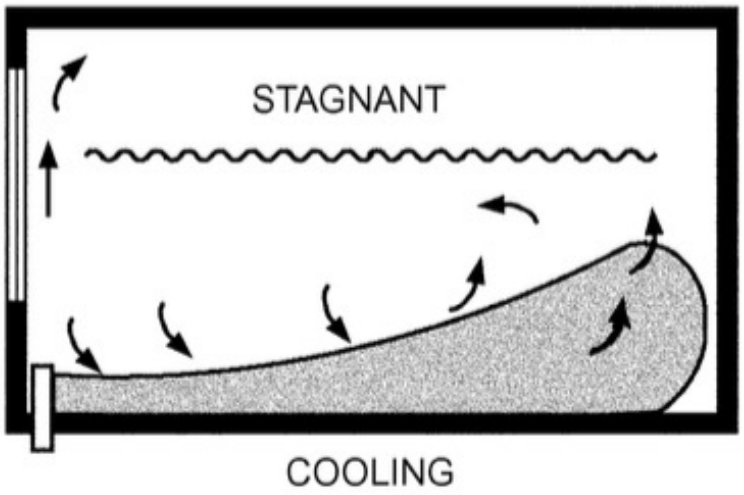
- They are good for displacement ventilation to remove large amount of contaminants from a space



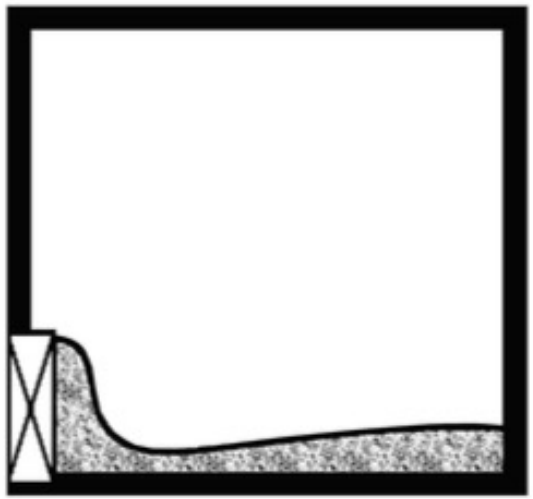
https://www.titus-hvac.com/image/385DF132-B511-42A2-9944-F5358C2B1234

Group D (Horizontal Discharge)

- Baseboard registers
- Low-sidewall registers



Outlet Group D (High Velocity) - (Nonisothermal)

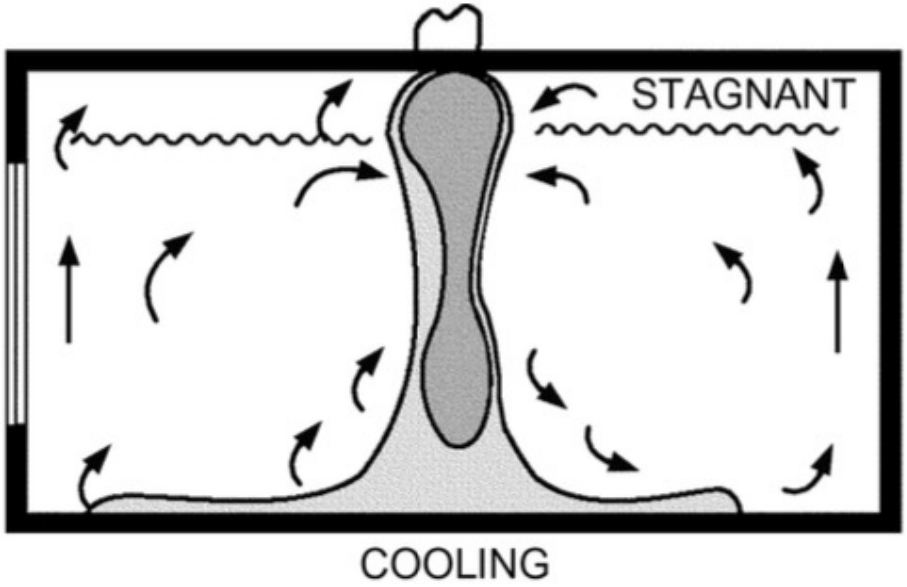


Outlet Group D (Low Velocity) - Nonisothermal

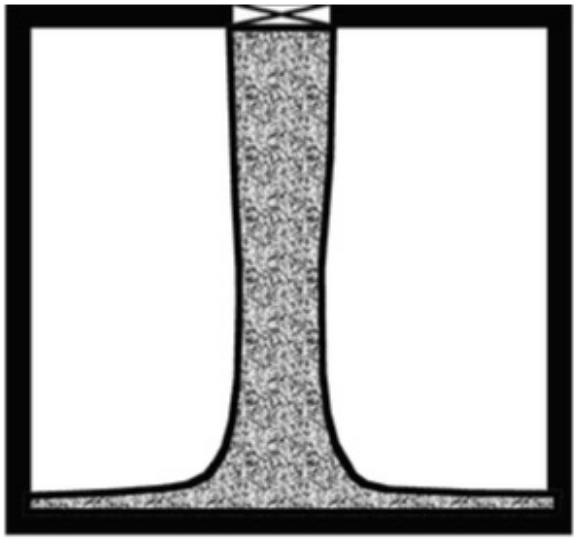
Group E (Vertical Discharge)

- These outlets are used in partially stratified systems
  - ❑ Ceiling diffusers
  - ❑ Linear grilles
  - ❑ Sidewall diffusers
- These outlets use low discharge velocities
- In mixed systems, they use higher discharge velocities
- Are used for a special applications such as cooling large glasses

Group E (Vertical Discharge)



Outlet Group E (High Velocity) - (Nonisothermal)



Outlet Group E (Low Velocity) - Nonisothermal

Return Air & Exhaust Grilles

- Less important than diffusers since velocity decreases significantly as the area increases
- Their location has little effect on room air motion (Supplies create the air flow patterns)
- Both supplies and returns should not be blocked by any objects
- The location of returns might be important when there is any pressure imbalance

Return Air & Exhaust Grilles

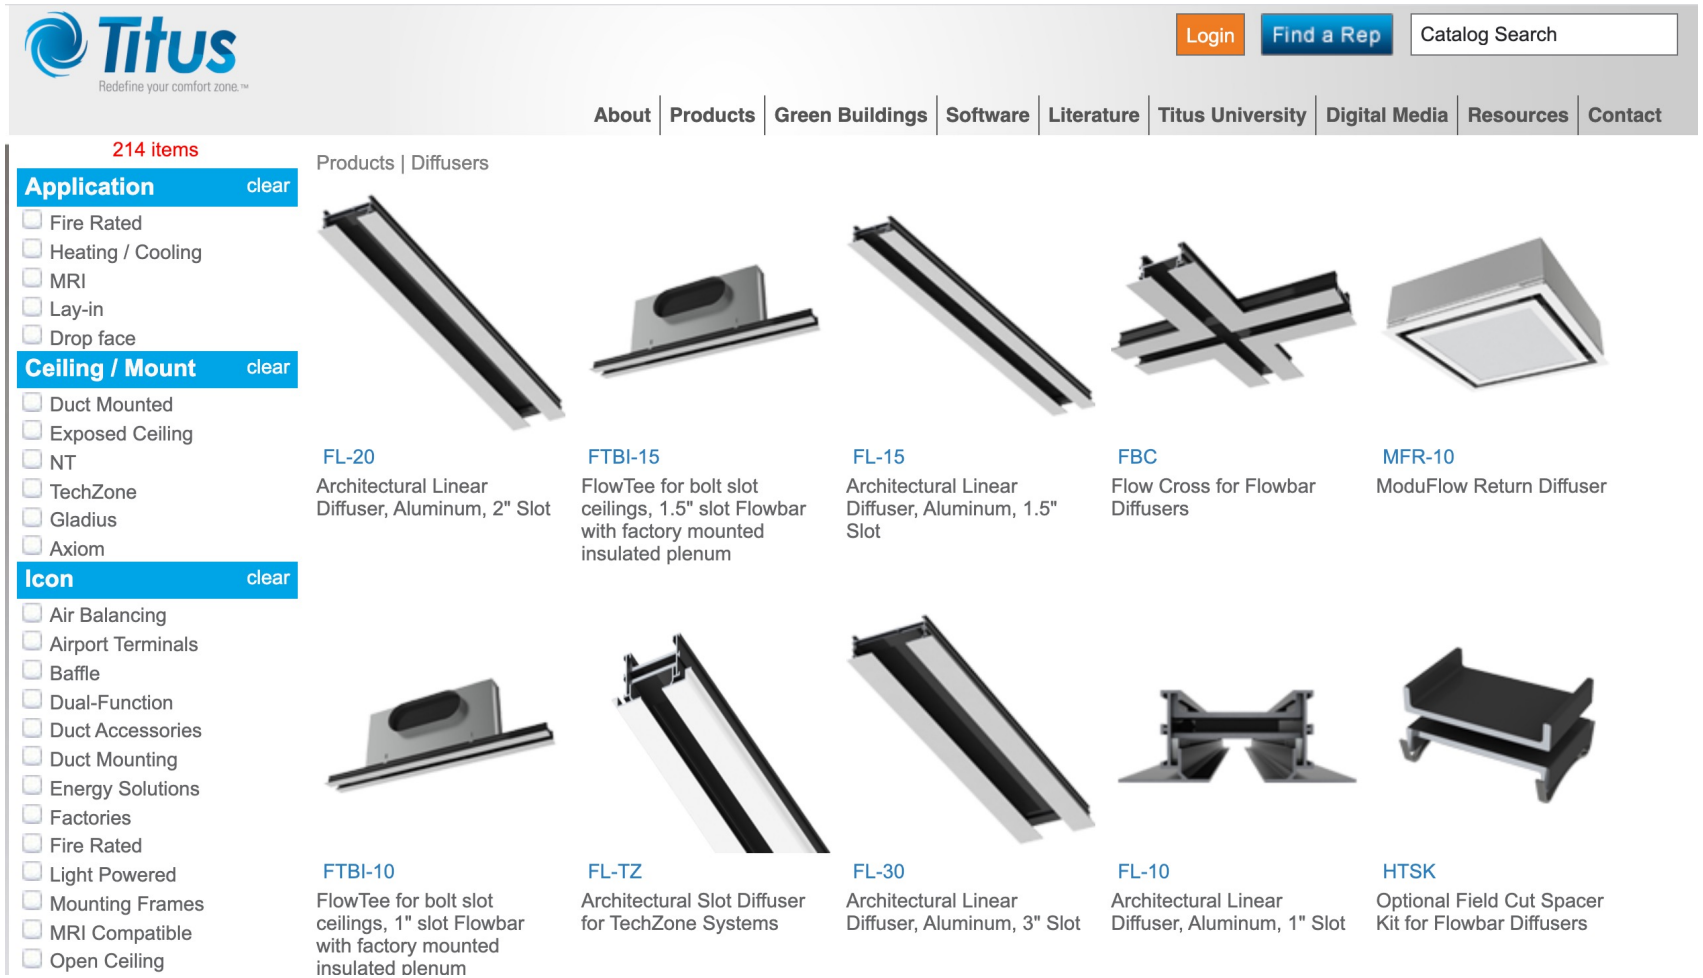
- From energy standpoint, it is economical to return the coolest air to the heating coil and warmest air to the cooling coil (Stagnation region)

- However, careful consideration is required for high ceiling, atrium, and large vertical glass surfaces

- Always, make sure ***to avoid short circuiting of supply air***

Supply and Return Options

- Please review some diffuser, grille, and register options for the next lectures



https://www.titus-hvac.com/Products/Diffusers

REVISITING ASHRAE 62.1

Revisiting ASHRAE 62.1

- ASHRAE 62.1 also provides:
  - ❑ Criterion for reduction in the outdoor delivery rate when recirculated air is treated
  - ❑ Criterion for variable ventilation rates when the air volume in the space can be used to dilute contaminants
- Many municipals have their own prescribed rates that can differ from ASHRAE
- ASHRAE 62.1 notation uses airflow rate as V

Revisiting ASHRAE 62.1

- Air change rate:

$$ACH = \frac{Volumetric\ flow\ rate}{Volume}\ (or\ \frac{60Q}{V}\ using\ cfm)$$

- Time Constant:

$$\tau = \frac{V}{Q} = \frac{m}{\dot{m}}$$

- ACH: Air change rate (air changes/hour)
- Q: Volumetric flow rate ft^3/hr
- V: Room volume ft^3
- τ: Time constant
- m: Mass of air in the space
- $\dot{m}$: mass flow rate of outdoor air

CLASS ACTIVITY

Class Activity

- Calculate the volumetric flow rate (in CFM and $\frac{ft^3}{hr}$) and time constant for the following condition:
  - ❑ Office area: 800 ft^2
  - ❑ Office height: 10 ft

Class Activity

- Solution:
  - ❑ Office areas usually have an ACH between 2 to 6

$$\tau = \frac{1}{2\ [1/hr]} = 0.5\ hour$$

$$2 = \frac{Q}{(800 \times 10)}$$

$$Q = 16{,}000\,\frac{ft^3}{hr} = 16{,}000 \times \frac{ft^3}{hr} \times \frac{1\ hr}{60\ minutes} = 266\ CFM$$

Air Change Terms

- Ventilation effectiveness provides measure of an air distribution system's ability to remove an internally generated pollutant

- Age-of-air (θ): Time in which some quantity of outside air has been in a particular building or space (hr)

Outdoor Air Requirement

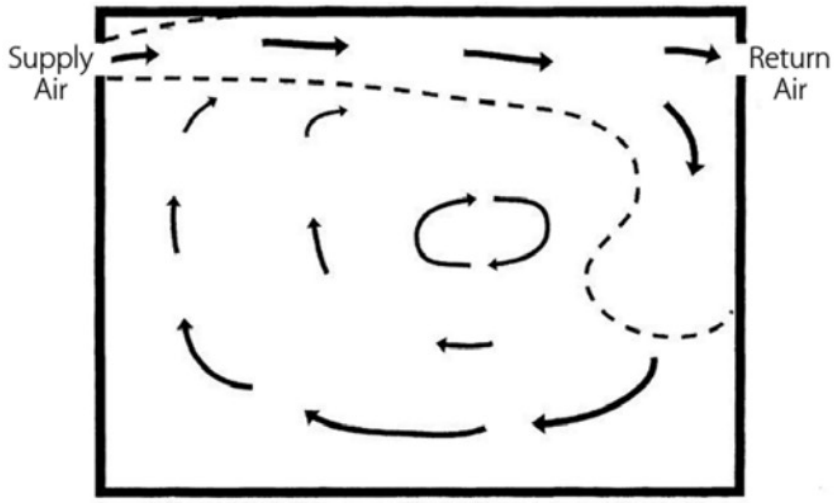
- The per person rate is to dilute the contaminants the occupants create
- The per space rate is related to dilute the contaminants created by furnishings and non-occupant activities
- Calculate the zone outdoor air flow rate from the breathing zone air flow rate

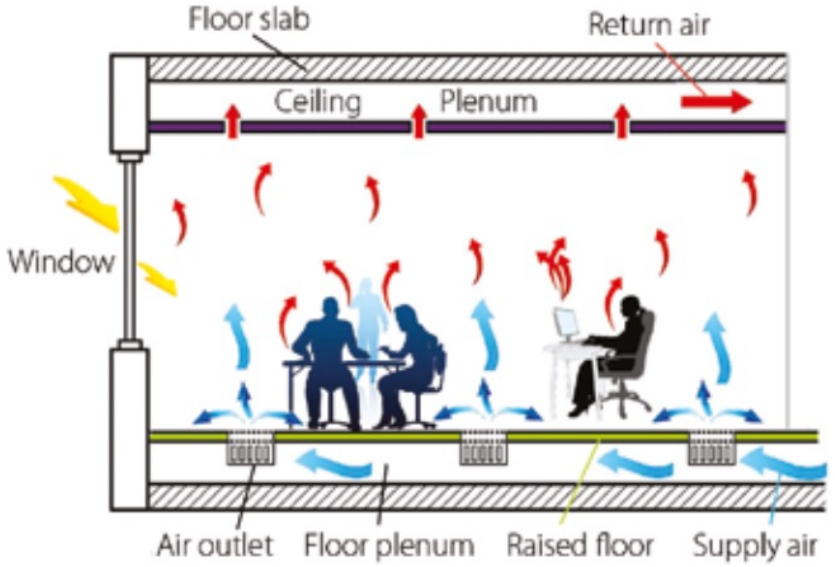
$$V_{oz} = \frac{V_{bz}}{E_z}$$

Ventilation Effectiveness

- The zone effectiveness depends upon
  - ❑ The location of the supply air diffusers
  - ❑ The location of he return air vents
  - ❑ Heating or cooling mode

- All three of these factors go into determining how much mixing takes place

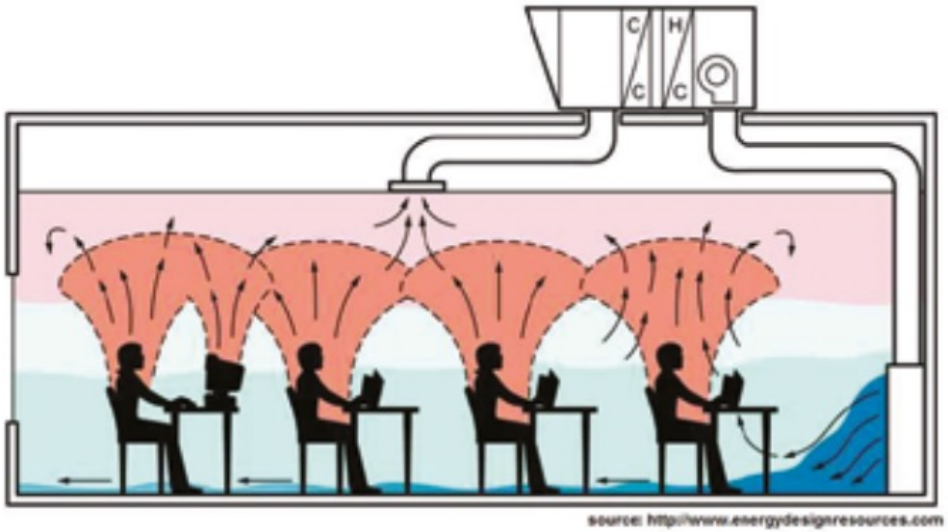




Ventilation Effectiveness

- It is better to use the ASHRAE 62.1 table, but common ventilation effectiveness are calculated as:

Heating/Cooling	Supply	Return	E_z
Cooling	Overhead	Overhead	1.0
Heating	Underfloor	Opposite	1.0
Heating	Overhead	Overhead	0.8
Heating	Displacement	Overhead	0.7



MECHANICAL DRAWINGS

Mechanical Drawings

- Please, see Chapter 38 of ASHRAE Fundamentals: Abbreviations and Symbols. This chapter entails:

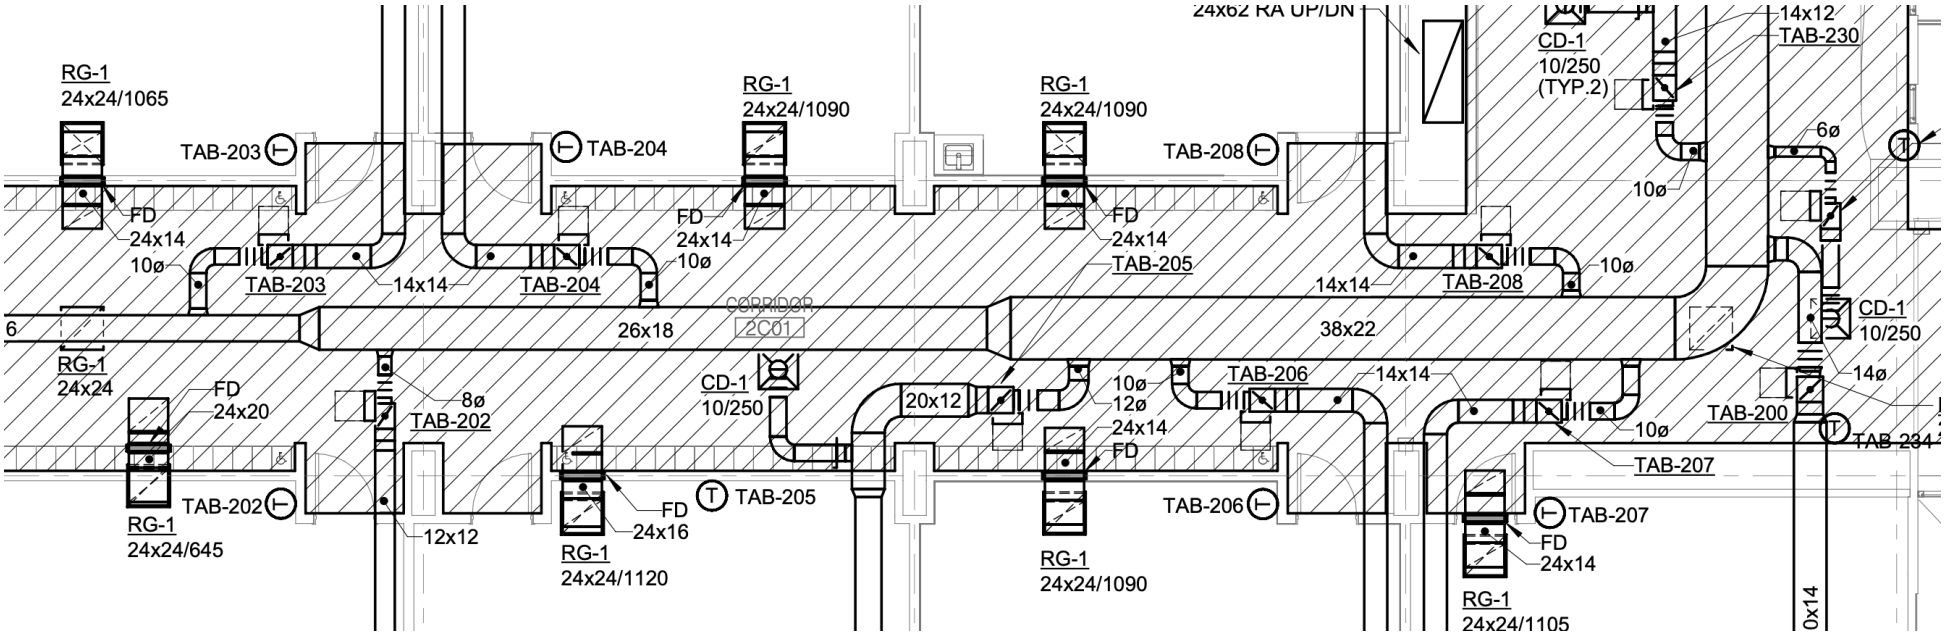
  - ❑ Abbreviations
  - ❑ Letter symbols
  - ❑ Graphical symbols

CHAPTER 38

ABBREVIATIONS AND SYMBOLS

Mechanical Drawings

- A good approach starts drawing on the existing architectural drawings:



Mechanical Drawings

- Look for the Mechanical Symbols, Notes, and Abbreviations page (usually M.000, M.00.00, …)

LOCATION:
3101 South Wabash Ave.
Chicago, IL 60616
